Computational Details

Characterization of single crystal X-ray diffraction

Based on the coherent diffraction of X-rays by the periodic arrangement of atoms in the crystal, the crystal structure of the compound is analyzed by recording the position and intensity of the diffraction points. In the structural analysis, the non-hydrogen atoms were initially positioned by difference Fourier synthesis, and the full matrix least squares refinement was performed by SHELXS-97 program. Hydrogen atoms adopt theoretical hydrogenation and participate in refinement based on the riding model. The experiment first determined the crystal system, orientation matrix and unit cell parameters of the single crystal. The data were corrected for Lorentz polarization and absorption to reduce systematic errors. Subsequently, SHELXL-97 was used to optimize the atomic parameters to make them consistent with the measured diffraction data, and the crystallographic data were verified by PLATON-99 to complete the whole process from structural optimization to verification. The crystallographic data of the complexes $M(\text{vim})_2(\text{DCA})_2$ ($M = \text{Mn, Fe, Co, Cu}$) are listed in **Table S1**, and the relevant bond lengths and bond angles are summarized in **Tables S2-S5**.

Heat of Formation

The heat of formation (ΔH_f) of the complex is calculated by the following reaction:¹

CP2K 2023.1 software was used to complete the calculation.² The electronic interaction is described by the PBE0 mixed functional,³ and the dispersion effect is corrected by the Grimme D3 method.⁴ The plane wave cutoff energy is set to 400 eV. The DZVP-MOLOPT-SR-GTH basis set is used for structural optimization,⁵ and the pob-TZVP basis set is used for single point energy calculation.⁶ The input file is generated by Multiwfn software.⁷ The ΔH_f calculation results of the complex $M(\text{vim})_2(\text{DCA})_2$ ($M = \text{Mn, Fe, Co, Cu}$) are shown in **Table S6**.

In order to explore the effect of the interaction between the complex and [BMIM]DCA on the thermodynamic properties of the propellant system. Through the following **Equations 1-4**, The ΔH_f (complex : fuel = $x : y = 0.1 : 0.9$) of the mixture of $M(\text{vim})_2(\text{DCA})_2$ ($M = \text{Mn, Fe, Co, Cu}$) and [BMIM]DCA was calculated. The ΔH_f of [BMIM]DCA was obtained from the literature.⁸

$$n_{\text{complex}} = \frac{x}{M_{\text{complex}}} \quad (1)$$

$$n_{\text{IL}} = \frac{y}{M_{\text{IL}}} \quad (2)$$

$$n_{\text{sum}} = n_{\text{complex}} + n_{\text{IL}} = \frac{x}{M_{\text{complex}}} + \frac{y}{M_{\text{IL}}} \quad (3)$$

$$\Delta_f H_{\text{mix}} = \frac{n_{\text{complex}}}{n_{\text{sum}}} * \Delta_f H_{\text{complex}} + \frac{n_{\text{IL}}}{n_{\text{sum}}} * \Delta_f H_{\text{IL}} \quad (4)$$
