1. Experimental details and results

Explanation for abbreviations in tables:

- a = aqueous phase
- o = organic phase
- in = initial
- e = equilibrium
- ρ = density
- O/A = organic to aqueous volumetric ratio
- D_{MSA} = distribution ratio = $\frac{[MSA]_{o,e}}{[MSA]_{a,e}}$
- E_{MSA} = extraction efficiency = $\frac{[MSA]_{o,e} \cdot (O/A)_e}{[MSA]_{aq,in}} \cdot 100$
- L_{MSA} = extractant loading = $\frac{[MSA]_{o,e} \cdot (O/A)_e}{[TBP]_{o,in}} \cdot 100$

The following equation can be used to convert the TBP concentration in *n*-dodecane from wt% to vol%:

$$[TBP] (vol\%) = \frac{[TBP] (wt\%) / \rho_{TBP}}{[TBP] (wt\%) / \rho_{TBP} + [dodecane] (wt\%) / \rho_{dodecane}}$$

with $\rho_{TBP} = 973 \text{ g L}^{-1}$ and $\rho_{dodecane} = 750 \text{ g L}^{-1}$.

Table S1. Experimental details for MSA–100 vol% TBP system collected at 25 °C with $O/A_{in} = 1$.
