Electronic Supplementary Information

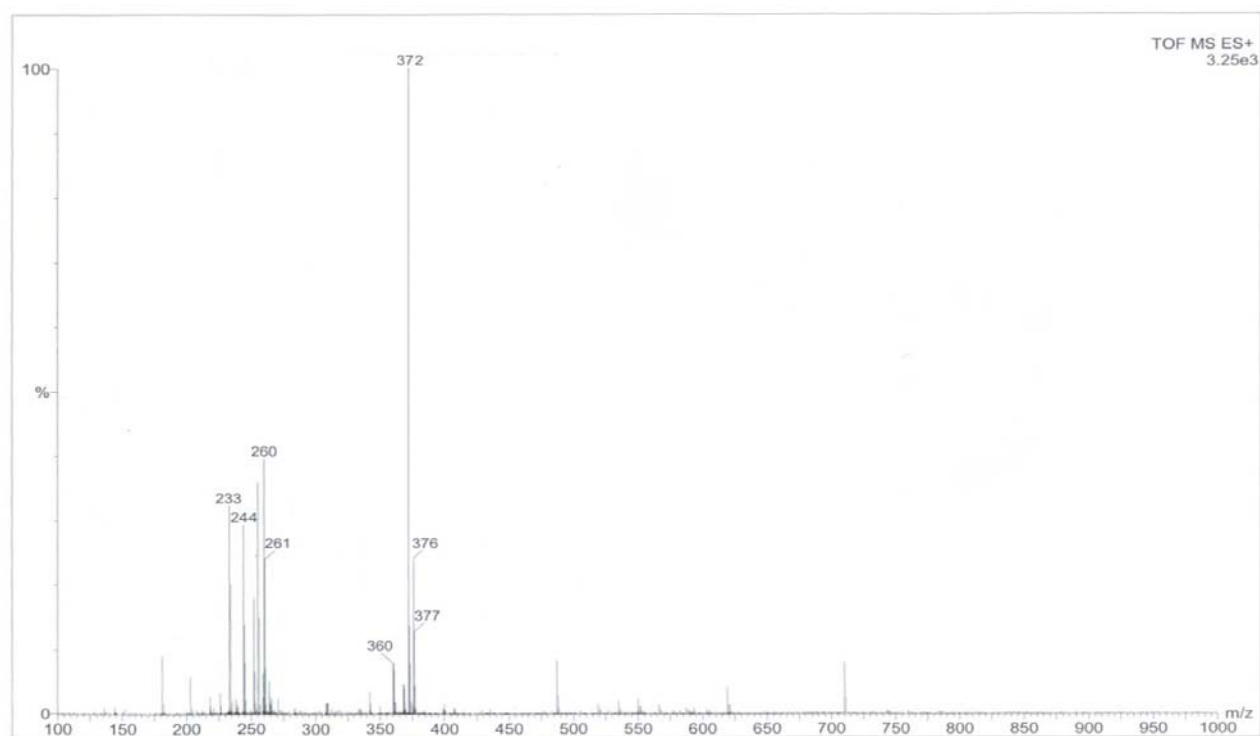

**Fig. S1.** ESI-MS spectrum of complex **1** in H<sub>2</sub>O showing the parent ion peak at m/z 221 (M-4ClO<sub>4</sub>)<sup>4+</sup>.

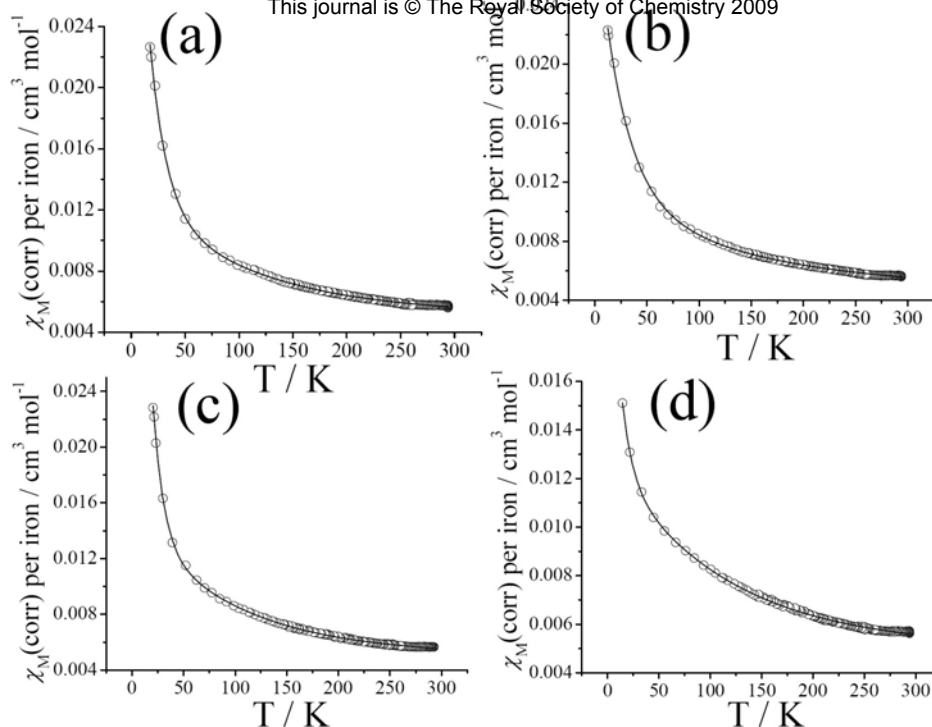

**Fig. S2.** ESI-MS spectrum of complex **2** in H<sub>2</sub>O showing the parent ion peak at m/z 273 (M-4ClO<sub>4</sub>)<sup>4+</sup>.

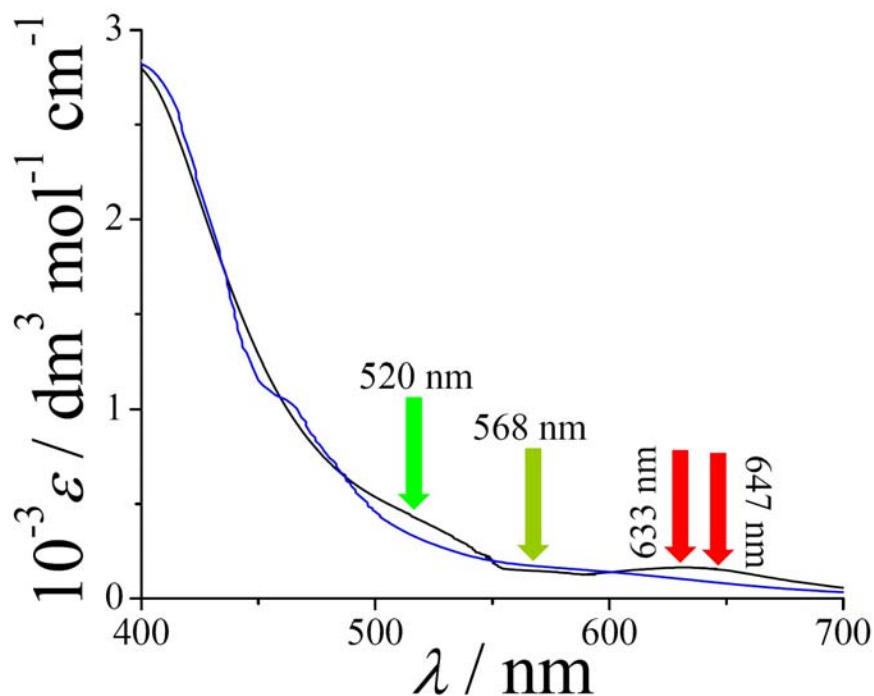

**Fig. S3.** ESI-MS spectrum of complex **3** in H<sub>2</sub>O showing the parent ion peak at m/z 302 (M-3ClO<sub>4</sub>)<sup>3+</sup>.

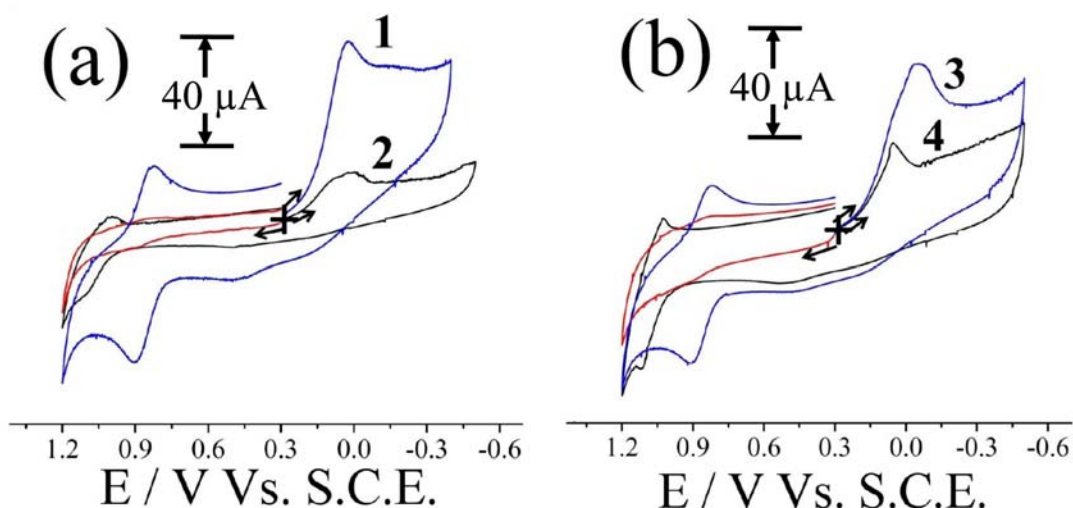

**Fig. S4.** ESI-MS spectrum of complex **4** in H<sub>2</sub>O showing the parent ion peak at m/z 372 (M-3ClO<sub>4</sub>)<sup>3+</sup>.

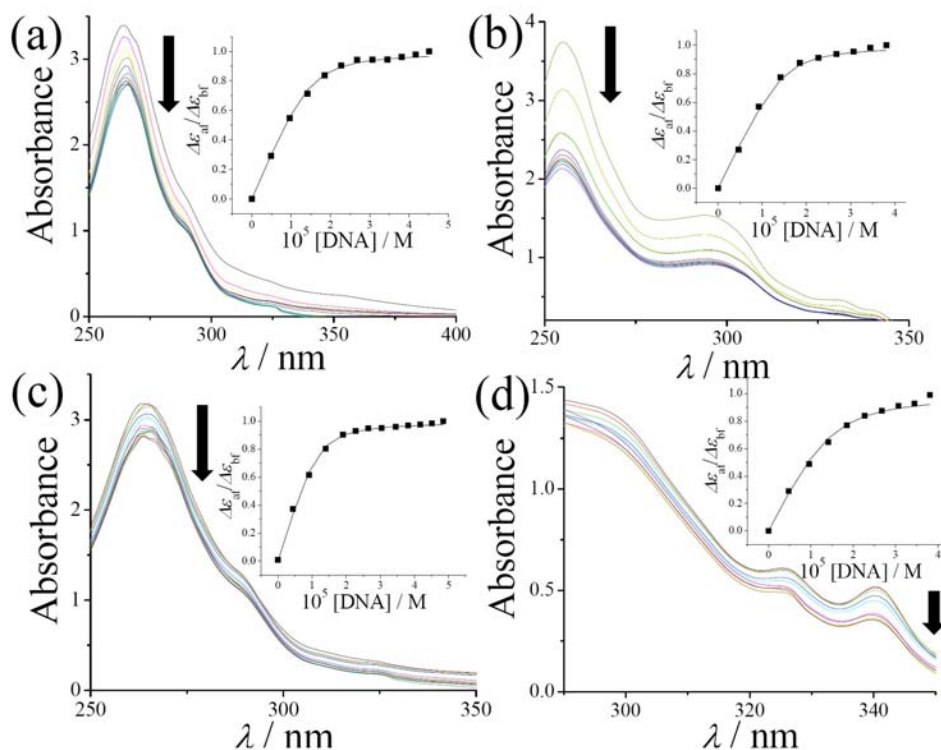

**Fig. S5.** Temperature dependence (295-18 K) of the molar magnetic susceptibility per iron(III) (circle) of the complexes **1** (a), **2** (b), **3** (c) and **4** (d). The solid lines represent the theoretical fits using the equation described in the text.

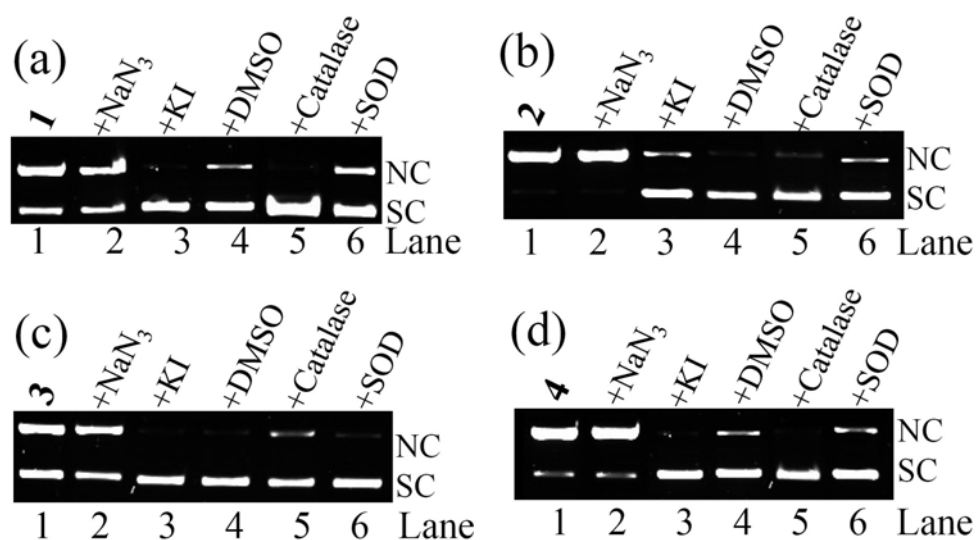

**Fig. S6.** The electronic spectra of the complexes **1**(—) and **3**(—) in Tris-HCl buffer showing the LMCT bands. The arrows indicate the wavelength of excitation used in the DNA cleavage experiment.

**Fig. S7.** The cyclic voltammetric responses of the complexes **1** and **2** (a) and **3** and **4** (b) in H<sub>2</sub>O-0.1M KCl at a scan rate of 50 mV s<sup>-1</sup> with reference to S.C.E. All the complexes display irreversible cyclic voltammetric response at ~100 mV with no anodic counterpart. The reversible voltammogram near 0.9 V is due to the formation of the binary complex of iron(II), viz. [Fe(phen)<sub>3</sub>]<sup>2+</sup> or [Fe(dpq)<sub>3</sub>]<sup>2+</sup> from degradation of diiron species. This voltammogram is not visible during only anodic scan (red line).

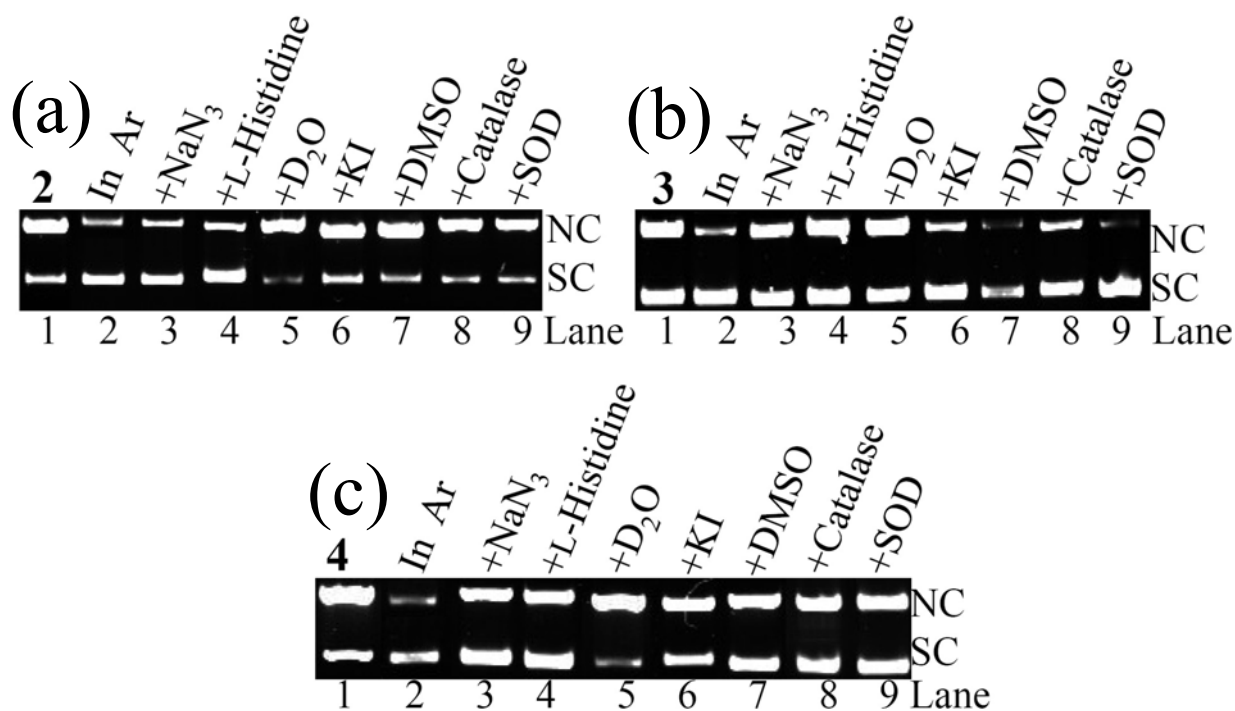

**Fig. S8.** Spectral traces showing the effect of addition of CT DNA (250 μM NP) to a 30 μM complex **1** (a), **2** (b), **3** (c) and **4** (d) in Tris-HCl buffer (pH 7.2) with the insets showing the MvH plots ( $\Delta\epsilon_{af}/\Delta\epsilon_{bf}$  vs. [DNA]). The experimental details are given in the text.

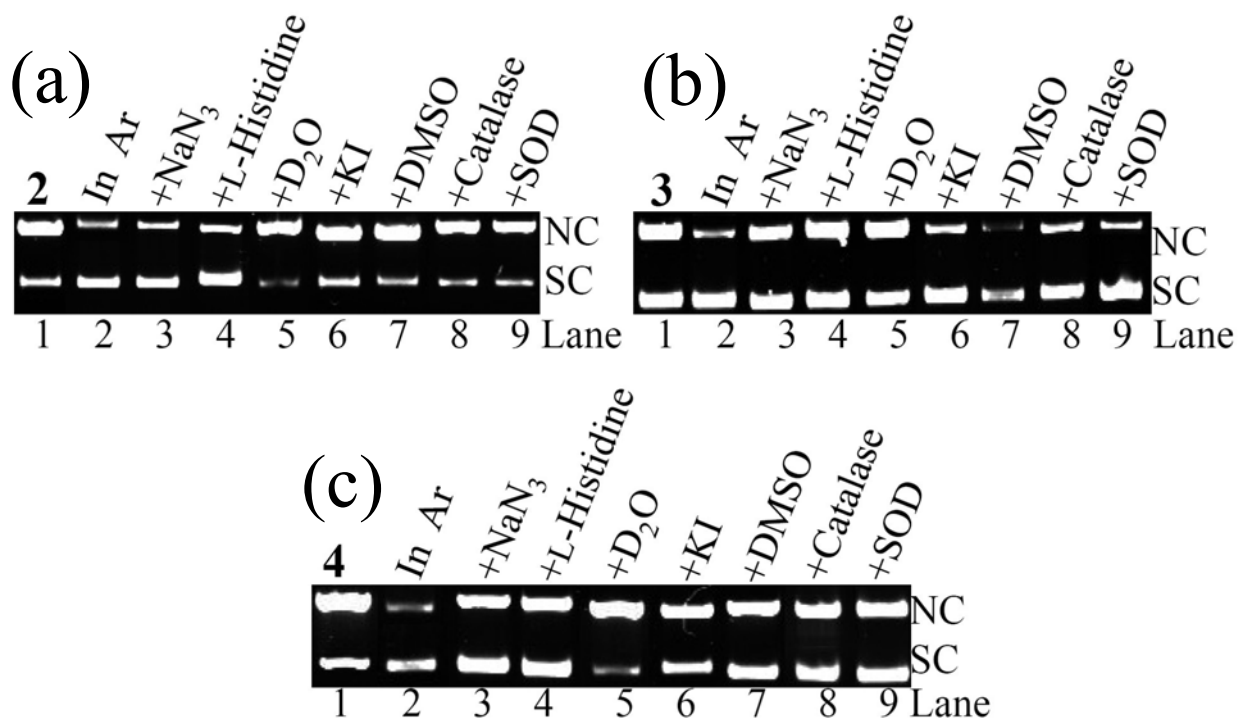

Complex + MPA (Fig.)	%NC form (Chemical Nuclease Activity)					
	Complex + MPA	+ $\text{NaN}_3^a$	+ $\text{KI}^b$	+ $\text{DMSO}^c$	+ $\text{Catalase}^d$	+ $\text{SOD}^e$
<b>1</b> + MPA (S9a)	63	60	9	19	11	27
<b>2</b> + MPA (S9b)	96	94	25	8	8	18
<b>3</b> + MPA (S9c)	53	55	6	5	15	7
<b>4</b> + MPA (S9d)	84	80	14	18	7	18

**Fig. S9.** The gel electrophoresis diagram showing the mechanistic aspects of chemical oxidation of SC pUC19 DNA (0.2  $\mu\text{g}$ , 30  $\mu\text{M}$ ) by the complexes (**1** – **4**) in the presence of the various additives in 50 mM Tris-HCl/NaCl buffer (pH 7.2) in the presence of 3-mercapto propionic acid (MPA) as a reducing agent. The percent of cleavage in the presence of various additives are tabulated. Complex concentration = 30  $\mu\text{M}$ . The %NC for DNA control is ~3%. <sup>a</sup> $[\text{NaN}_3]$  = 500  $\mu\text{M}$ . <sup>b</sup> $[\text{KI}]$  = 500  $\mu\text{M}$ . <sup>c</sup> $\text{DMSO}$  = 6  $\mu\text{L}$ . <sup>d</sup> $\text{SOD}$  = 2 units. <sup>e</sup> $\text{Catalase}$  = 2 units.

Complex (Fig.)	% NC form (photo-irradiation at 365 nm)								
	Complex	+ $\text{NaN}_3^a$	+ L-Histidine <sup>b</sup>	+ $\text{D}_2\text{O}^c$	+ $\text{KI}^d$	In Argon	+ DMSO <sup>e</sup>	+ Catalase <sup>f</sup>	+ SOD <sup>g</sup>
2 (S10a)	83	21	17	90	84	24	85	87	80
3 (S10b)	67	70	72	68	10	20	15	15	18
4 (S10c)	96	48	53	91	64	25	50	56	71

**Figure S10.** The gel electrophoresis diagram showing the mechanistic aspects of photocleavage of SC pUC19 DNA (0.2  $\mu\text{g}$ , 30  $\mu\text{M}$ ) by the complexes in the presence of the various additives in 50 mM Tris-HCl/NaCl buffer (pH 7.2) on photoexposure of UV light of 365 nm. The percent of cleavage in the presence of various additives are tabulated. Complex concentration = 5.5  $\mu\text{M}$ . The exposure time for the complexes is 2 h. The %NC for DNA control is ~2%. <sup>a</sup>[ $\text{NaN}_3$ ] = 200  $\mu\text{M}$ . <sup>b</sup>[L-His] = 200  $\mu\text{M}$ . <sup>c</sup> $\text{D}_2\text{O}$  = 16  $\mu\text{L}$ . <sup>d</sup>[KI] = 200  $\mu\text{M}$ . <sup>e</sup>DMSO = 6  $\mu\text{L}$ . <sup>f</sup>SOD = 2 units. <sup>g</sup>Catalase = 2 units.

Complex (Fig.)	% NC form (photo-irradiation in visible light)								
	Complex	In Argon	+ $\text{NaN}_3^{\text{a}}$	+L-Histidine <sup>b</sup>	+ $\text{D}_2\text{O}^{\text{c}}$	+KI <sup>d</sup>	+DMSO <sup>e</sup>	+Catalase <sup>f</sup>	+SOD <sup>g</sup>
