Synthesis and Characterization of [(n-C₄H₉)₄N]₂[SeO₄{WO(O₂)₂}₂] (I). The tetra-n-butylammonium salt derivative of [SeO₄{WO(O₂)₂}₂]²⁻ was synthesized according to the literature procedure.^{S1} In 15% aqueous H₂O₂ (9.25 mL, 42 mmol), H₂WO₄ (1.75 g, 7 mmol) was suspended and the resulting suspension was stirred at 305 K for 30 min. The pale yellow solution was filtered to remove insoluble materials followed by addition of 80% H₂SeO₄ (2.1 mL, 28 mmol). The solution was stirred at 273 K for 60 min and an excess amount of [(n-C₄H₉)₄N](NO₃) (3.05 g, 10 mmol) was added in a single step. The solution was stirred at 273 K for 30 min and the white precipitate (1.07 g) was collected by the filtration followed by the washing with an excess amount of H₂O and diethyl ether. The precipitate was evacuated to dryness. A portion of the product (0.2 g) was dissolved in the acetonitrile solution (1 mL) containing a drop of H₂O₂ at 298 K and the solution was cooled to 277 K. The colorless plate-like crystalline solid was obtained by vapor diffusion of diethyl ether into the acetonitrile solution. Kinetic Derivation. The selenium-containing dinuclear peroxotungstate **I** reacts with a sulfide, leading to a sulfoxide and the subsequent peroxy species **II** (eqn (S1)):

Then, **I** is regenerated by the reaction of **II** with an H₂O₂ (eqn (S2)):

From the steady-state approximation on **I** and **II** (eqns (S3) and (S4)) and the mass balance (eqn (S5)), the rate of the formation of sulfoxide can be expressed by (eqn (S6)):

$$\frac{d[\text{I}]}{dt} = -k_1[\text{sulfide}][\text{I}] + k_2[\text{II}][\text{H}_2\text{O}_2] - k_{-2}[\text{I}][\text{H}_2\text{O}] = 0 \quad (\text{S3})$$

$$\frac{d[\text{II}]}{dt} = k_1[\text{sulfide}][\text{I}] - k_2[\text{II}][\text{H}_2\text{O}_2] + k_{-2}[\text{I}][\text{H}_2\text{O}] = 0 \quad (\text{S4})$$

$$[\text{I}]_t = [\text{I}] + [\text{II}] \quad (\text{S5})$$

$$R_0 = \frac{d[\text{sulfoxide}]}{dt} = \frac{k_1 k_2 [\text{I}]_t [\text{sulfide}] [\text{H}_2\text{O}_2]}{k_1 [\text{sulfide}] + k_2 [\text{H}_2\text{O}_2] + k_{-2} [\text{H}_2\text{O}]} \quad (\text{S6})$$

When the k_1 , k_2 , and k_{-2} values in eqn (S6) are 9.3, 2.6, and $2.0 \times 10^{-1} \text{ M}^{-1}\text{s}^{-1}$, respectively, the experimental data in Figures 4 and 5 could be fitted with a simulation curve calculated using eqn (S6). All the kinetic data were fitted with the Igor Pro ver. 5.05 program.

^a Reaction conditions: **I** (0.1 mol% relative to substrate and H₂O₂), sulfide (1 mmol), 30% aqueous H₂O₂ (1 mmol), CH₃CN (6 mL), 293 K. Yield and selectivity were determined by GC and NMR. Figure S1 Transition-state structures and the corresponding activation barriers for the oxidation of dimethyl sulfide (bond lengths in Å). Orange, gray, red, black, and light blue balls represent selenium, tungsten, oxygen, carbon, and hydrogen atoms, respectively.

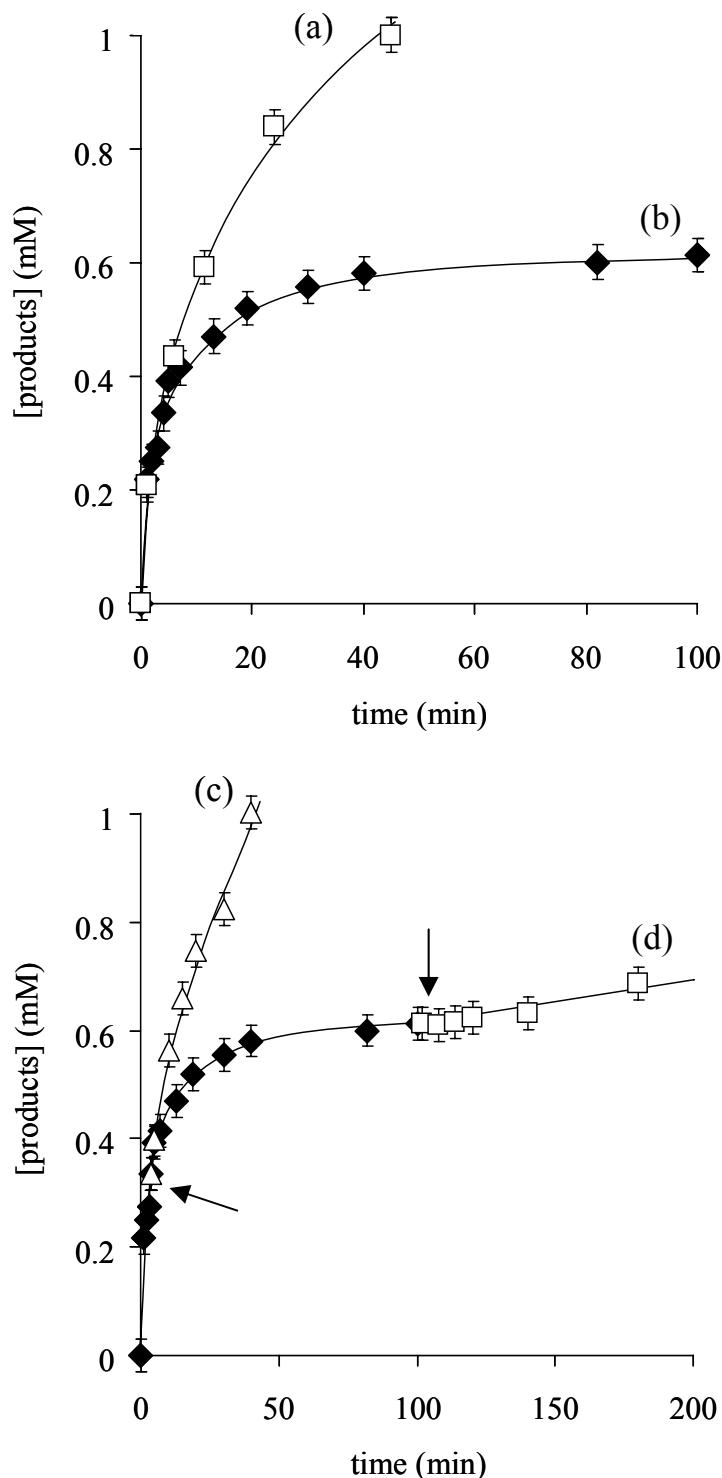

Figure S2 Reaction profiles for the (a) catalytic and (b, c, and d) stoichiometric oxidation of diphenyl sulfide by **I**. (a) Reaction conditions: **I** (0.31 mM), diphenyl sulfide (3.12 mM), 30% aqueous H₂O₂ (3.12 mM) CH₃CN (3.2 mL), 233 K. (b) Reaction conditions: **I** (0.31 mM), diphenyl sulfide (3.12 mM), CH₃CN (3.2 mL), 233 K. (c) After 4 min (i.e., one equivalent of the active oxygen with respect to **I** was transferred), 30% aqueous H₂O₂ (3.12 mM) was added as indicated by an arrow. (d) After 100 min (i.e., two equivalents of the active oxygen with respect to **I** were transferred), 30% aqueous H₂O₂ (3.12 mM) was added as indicated by an arrow. Yield and selectivity were determined by LC. [Products] (mM) = ([sulfoxide] + 2×[sulfone]) (mM).

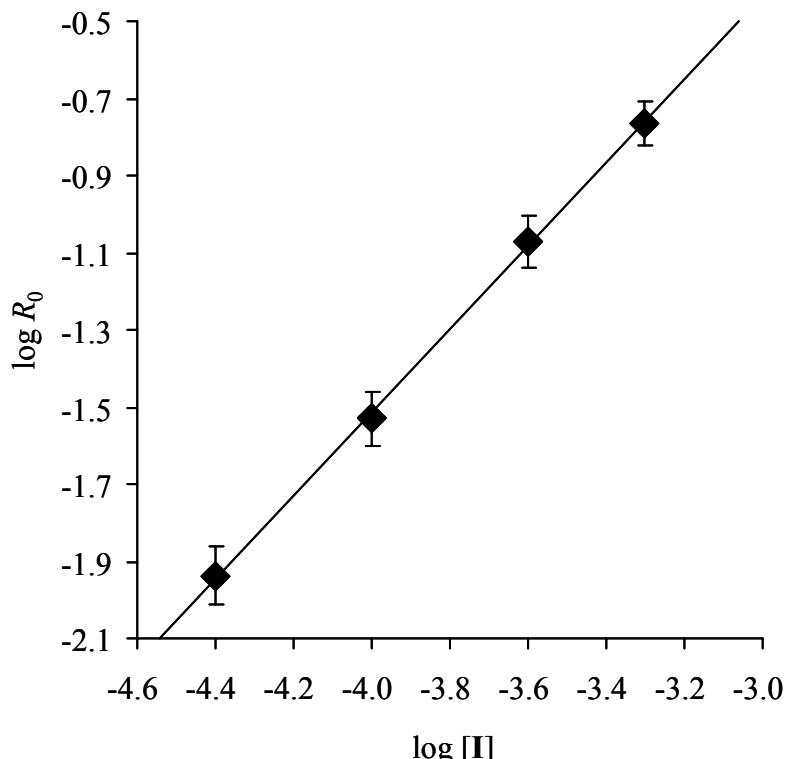

Figure S3 Dependence of the reaction rate on the concentration of **I**: **I** (0.04–0.50 mM), thioanisole (50 mM), H₂O₂ (50 mM), H₂O (250 mM), CH₃CN (6 mL), 273 K. R_0 values were determined from the reaction profiles at low conversions (<20%) of both thioanisole and H₂O₂. Slope = 1.08 ($R^2 = 0.99$).
