## Experimental

## General

All chemicals and solvents were analytical reagent grade, purchased commercially and used as such. Analytical grade metal salts were used in a UV/VIS absorption experiments. Cyclophanes $\mathbf{3}$ and $\mathbf{4}$ were prepared previously from the reaction of piperazine and 1,3-bis(bromomethyl)-2-nitrobenzene under the high-dilution conditions followed by reduction of nitro-groups with stannous(II)chloride. ${ }^{1}$ Melting points were measured with Mettler Toledo FP62 apparatus. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Bruker Avance DRX 500 FT NMR spectrometer operating at 500 MHz and 125 MHz by using $\mathrm{CD}_{3} \mathrm{OD}$ as a solvent at $-40^{\circ} \mathrm{C}$. Mass spectra were obtained on a Micromass (ESI-TOF) spectrometer. Elemental analyses were performed with Elementar Analysesysteme GmbH VariolEL. UV/VIS spectra were recorded with Perkin Elmer Lambda 650 UV/VIS spectrophotometer.

## Synthesis

1: diethyl $2,2^{\prime}$-bipyridine-5,5'-dicarboxylate was prepared according to the previously published procedure ${ }^{2}$ from ethyl nicotinate in $10 \%$ of palladium carbon. Yield: 7.2 g (6\%) of colourless needles; m.p. $149{ }^{\circ} \mathrm{C}$ (lit., ${ }^{2} 145-157{ }^{\circ} \mathrm{C}$ ); ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=1.43(\mathrm{t}, 6 \mathrm{H}), 4.44(\mathrm{q}, 4 \mathrm{H}), 8.42(\mathrm{~d}, 2 \mathrm{H}), 8.57(\mathrm{~d}, 2 \mathrm{H}), 9.28(\mathrm{~s}, 2 \mathrm{H}) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 126 \mathrm{MHz}, \mathrm{CDCl} 3\right): \delta=14.5,61.7,121.5,126.8,138.3,150.8,158.5$, 165.4 ppm .

2: Powdered $\mathrm{KOH}(0.56 \mathrm{~g}, 10 \mathrm{mmol})$ was dissolved in ethanol ( 65 ml ) and added drop wise into the refluxing ethanol solution ( 40 ml ) of $\mathbf{1}(3.0 \mathrm{~g}, 10 \mathrm{mmol})$. Insoluble potassium salt of 5'-(ethoxycarbonyl)-2,2'-bipyridine-5-carboxylic acid precipitated after few minutes. The bulk white solid was refluxed for additional 2 h , stirred at RT overnight and then collected by filtration. The crude product was mixed in dry dichloromethane (20 ml ) and filtered again to obtain potassium (ethoxycarbonyl)-2,2'-bipyridine-5carboxylate. The potassium salt was mixed into thionyl chloride ( 20 ml ) and refluxed under nitrogen for 4 h . The clear solution was cooled and evaporated to dryness. The crude product was dissolved in dry dichloromethane ( 30 ml ) and the insoluble residues were filtered off. The filtrate was collected and evaporated to dryness to obtain $\mathbf{2}$ as yellowish oil. Yield $1.76 \mathrm{~g}(60 \%) ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=1.45(\mathrm{t}, 3 \mathrm{H}), 4.55(\mathrm{q}$, $2 \mathrm{H}), 8.40-8.54(\mathrm{~m}, 2 \mathrm{H}), 8.58-8.72(\mathrm{~m}, 2 \mathrm{H}), 9.25-9.37(\mathrm{~m}, 2 \mathrm{H}) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=14.50,61.92,121.99,122.11,127.46,129.69,138.62$, $139.92,150.80,151.83,157.40,160.15,165.11,167.05 \mathrm{ppm}$.

5: A mixture of $2(1.40 \mathrm{~g}, 4.82 \mathrm{mmol})$ and dry dichloromethane ( 60 ml ) was added into the stirred solution of cyclophane $3(0.700 \mathrm{~g}, 1.15 \mathrm{mmol})$, triethylamine ( $0.550 \mathrm{~g}, 5.44$ mmol ) and dichloromethane ( 20 ml ) at RT. The reaction mixture was poured into the dropping funnel and extracted with aqueous $\mathrm{K}_{2} \mathrm{CO}_{3}$ solution ( 100 ml ). The organic layer was collected and dried by using $\mathrm{K}_{2} \mathrm{SO}_{4}$ and evaporated to dryness. The crude product was purified with flash chromatography by using DCM:MeOH:TEA (50:1:1) as eluent to obtain 5 as a white powder. Yield $1.47 \mathrm{~g}(93 \%) ;{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz},-40{ }^{\circ} \mathrm{C}, \mathrm{CDCl}_{3}$ ): $\delta$ $=1.44(\mathrm{t}, 9 \mathrm{H}), 1.51(\mathrm{t}, 3 \mathrm{H}), 1.84(\mathrm{t}, 3 \mathrm{H}), 2.17(\mathrm{t}, 6 \mathrm{H}), 2.47(\mathrm{t}, 3 \mathrm{H}), 2.53(\mathrm{t}, 3 \mathrm{H}), 2.96(\mathrm{~d}$,
$3 H), 3.02(\mathrm{~d}, 3 \mathrm{H}), 3.20(\mathrm{~d}, 6 \mathrm{H}), 3.92(\mathrm{~d}, 3 \mathrm{H}), 3.98(\mathrm{~d}, 3 \mathrm{H}), 4.42(\mathrm{q}, 6 \mathrm{H}), 7.01(\mathrm{~d}, 3 \mathrm{H})$, $7.10(\mathrm{t}, 3 \mathrm{H}), 7.62(\mathrm{~d}, 3 \mathrm{H}), 8.38-8.55(\mathrm{~m}, 12 \mathrm{H}), 9.21(\mathrm{~s}, 3 \mathrm{H}), 9.28(\mathrm{~s}, 3 \mathrm{H}), 11.54(\mathrm{~s}, 3 \mathrm{H})$ ppm; ; ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 126 \mathrm{MHz},-40{ }^{\circ} \mathrm{C}, \mathrm{CDCl}_{3}\right): \delta=14.22,50.78,53.78,54.95$, 58.01, 61.67, 121.12, 125.78, 126.01, 128.33, 129.19, 129.34, 133.93, 135.01, 136.01, 138.26, 148.48, 150.34, 157.26, 157.52, 163.14, 165.09 ppm ; ESI-MS (m/z): 1372.42 $[\mathrm{M}+\mathrm{H}]^{+}, 1394.37[\mathrm{M}+\mathrm{Na}]^{+}, 1410.37[\mathrm{M}+\mathrm{K}]^{+}$; Elemental analysis; calculated form $\left(\mathrm{C}_{78} \mathrm{H}_{81} \mathrm{~N}_{15} \mathrm{O}_{9}\right)_{5} \cdot \mathrm{CH}_{2} \mathrm{Cl}_{2} \cdot \mathrm{CH}_{3} \mathrm{OH}: \mathrm{C}=67.36, \mathrm{H}=6.01, \mathrm{~N}=14.95 \%$; found: $\mathrm{C}=67.45, \mathrm{H}$ $=5.95, \mathrm{~N}=15.05 \%$.

6: A mixture of $2(0.172 \mathrm{~g}, 0.591 \mathrm{mmol})$ and dry dichloromethane $(25 \mathrm{ml})$ was added into the stirred solution of cyclophane $4(0.117 \mathrm{~g}, 1.15 \mathrm{mmol})$, triethylamine ( $0.073 \mathrm{~g}, 0.72$ $\mathrm{mmol})$ and dichloromethane $(5 \mathrm{ml})$ at RT . The reaction mixture was poured into the dropping funnel and extracted with aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ solution ( 20 ml ). The organic layer was collected and dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated to dryness. The crude product was purified with flash chromatography with DCM:MeOH:TEA (50:1:1) as eluent to obtain 6 as a white powder. Yield $0.25 \mathrm{~g}(95 \%) ;{ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz},-40^{\circ} \mathrm{C}, \mathrm{CDCl}_{3}\right): \delta=1.41(\mathrm{t}$, $12 \mathrm{H}), 1.81(\mathrm{t}, 4 \mathrm{H}), 2.03(\mathrm{t}, 4 \mathrm{H}), 2.30-2.65(\mathrm{~m}, 16 \mathrm{H}), 2.81(\mathrm{~d}, 4 \mathrm{H}), 3.05(\mathrm{~d}, 4 \mathrm{H}), 3.21(\mathrm{t}$, 8H), 3.92 (dd, 8H), 4.41 (q, 8H), 7.06 (d, Hz, 4H), 7.17 (t, 4H), 7.72 (d, 4H), 8.38 - 8.70 $(\mathrm{m}, 16 \mathrm{H}), 9.22(\mathrm{~s}, 4 \mathrm{H}), 9.28(\mathrm{~s}, 4 \mathrm{H}), 11.33(\mathrm{~s}, 4 \mathrm{H}) \mathrm{ppm} ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 126 \mathrm{MHz},-40\right.$ $\left.{ }^{\circ} \mathrm{C}, \mathrm{CDCl}_{3}\right): \delta=14.20,51.43,54.40,57.63,61.66,62.24,121.10,121.79,125.70,126.07$, $127.50,127.89,129.47,129.79,133.77,134.90,136.90,138.32,148.26,150.49,157.53$, 157.72, 162.56, $165.04 \mathrm{ppm} ;$ ESI-MS (m/z): $1830.70[\mathrm{M}+\mathrm{H}]^{+}, 1851.66[\mathrm{M}+\mathrm{Na}]^{+}$,
$1867.81[\mathrm{M}+\mathrm{K}]^{+}$; Elemental analysis; calculated form $\mathrm{C}_{104} \mathrm{H}_{108} \mathrm{~N}_{20} \mathrm{O}_{12} \cdot \mathrm{CH}_{2} \mathrm{Cl}_{2} \cdot \mathrm{CH}_{3} \mathrm{OH}$ : C $=67.15, \mathrm{H}=6.08, \mathrm{~N}=15.02 \%$; found: $\mathrm{C}=67.26, \mathrm{H}=5.93, \mathrm{~N}=14.99 \%$.

7: A suspension of $5(0.123 \mathrm{~g}, 0.09 \mathrm{mmol})$, powdered $\mathrm{KOH}(0.500 \mathrm{~g}, 8.91 \mathrm{mmol})$ and ethanol ( 4 ml ) was stirred at $75^{\circ} \mathrm{C}$ for 12 h . The clear mixture was cooled and carefully neutralized with conc. HCl . The resulted white precipitate was collected by filtration and washed abundantly with water and ethanol and recrystallized form $\mathrm{FeSO}_{4}$ solution to obtain red prisms. Yield 0.63 g ; ESI-MS (m/z): $428.1[\mathrm{M}-3 \mathrm{H}]^{3-}$.

## UV/VIS spectroscopy

Job's plot: The measurements were carried out in $0.35 \mathrm{M}(\mathrm{pH} 2.6)$ acetic acid solutions at $21.7^{\circ} \mathrm{C}$. Job's plot was prepared from the absorption spectra of eleven mixtures, where the mole fraction of the ligand $\boldsymbol{x}_{\mathrm{L}}$ was varied from 0 to 1 , while the total concentration $\left(c[\mathbf{5}]_{\mathrm{aq}}+c\left[\mathrm{Fe}^{2+}\right]_{\mathrm{aq}}+c[\mathbf{5} \cdot \mathrm{Fe}]^{2+}{ }_{\mathrm{aq}}=0,203 \mathrm{mM}\right.$ and $c[\mathbf{6}]_{\mathrm{aq}}+c\left[\mathrm{Fe}^{2+}\right]_{\mathrm{aq}}+c[\mathbf{6} \cdot \mathrm{Fe}]^{2+}{ }_{\mathrm{aq}}=0,265$ mM ) was kept constant (Figures S1 and S2). The absorption maxima (A) for each spectrum was recorded $(574 \mathrm{~nm})$. Assuming that only one $\left[\mathbf{L}_{\mathbf{n}} \cdot M\right]^{2+}{ }_{\text {aq }}$ complex is formed, the value of $\boldsymbol{n}$ was calculated from the equation $\boldsymbol{n}=\boldsymbol{x}_{\text {max }} / \mathbf{1}-\boldsymbol{x}_{\text {max }}$, where the $\boldsymbol{x}_{\text {max }}$ is the mole fraction of the ligand $(x[5]$ or $x[\mathbf{6}])$ at the absorption maxima (Figures S3 and S4).

Figure S1. UV/VIS measurement of the complex of 5 (Ligand) and $\mathrm{Fe}\left(\mathrm{BF}_{4}\right)_{2}(F e)$, showing increment of absorption at 574 nm , where the samples 1 to 9 represents the molar fractions from 1:9 to 9:1 of [5]:[ $\left.\mathrm{Fe}^{2+}\right]$.

Figure S2. UV/VIS measurement of the complex of 6 (Ligand) and $\mathrm{Fe}\left(\mathrm{BF}_{4}\right)_{2}(F e)$, showing increment of absorption at 574 nm , where the samples 1 to 9 represents the molar fractions from 1:9 to $9: 1$ of $[\mathbf{6}]:\left[\mathrm{Fe}^{2+}\right]$

Figure S3. Job's plot in 0.35 M acetic acid solution showing the maximum absorption A, and extrapolated absorption $\mathrm{A}_{\text {extr }}$ for $\left[5 \cdot \mathrm{Fe}^{2+}{ }_{\mathrm{aq}}\right.$ (above).

Figure S4. Job's plot in 0.35 M acetic acid solution showing the maximum absorption A, and extrapolated absorption $A_{\text {extr }}$ for $[\mathbf{6} \cdot \mathrm{Fe}]^{2+}{ }_{\text {aq }}$.

Determination of complex stability constants $\log K_{(5)}, \log K_{(6)}$ and the relative stability $\boldsymbol{R}_{(5 / 6)}$ from the Job's plots of $[5 \cdot \mathrm{Fe}]^{2+}{ }_{\text {aq }}$ and $[6 \cdot \mathrm{Fe}]^{2+}{ }_{\mathrm{aq}}$.

Under the acidic ( pH 2.61 ) experimental conditions, each $2,2^{\prime}$-bipyridine groups (bipy) in ligands 5 and $\mathbf{6}$ were assumed to be protonated once. During the complexation, the pyridines were also assumed to coordinate $\mathrm{Fe}^{2+}$ ion independently (bidentate, tetradentate or octadentate binding).
$\mathbf{K}_{i}$ is the stability constant $\boldsymbol{K}_{(5)}$ and $\boldsymbol{K}_{(6)}$ of the ligands $\mathbf{5}$ and $\mathbf{6}$. The same $\mathrm{pH}(=2,61)$ was used in all experiments. $\log K_{a}$ values for each $2,2^{\prime}$-bipyridine moieties in 5 and $\mathbf{6}$ were approximated to be equal with $2,2^{\prime}$-bipyridine $\left(\log K_{\mathrm{a}}=4.30\right)$ (equation 1 ).

$$
\begin{equation*}
K_{i}=K_{i}^{\text {tot }} \times \frac{1}{\left(K_{a}\right)^{3}}=\frac{\left[(\text { bipy })_{3} F e^{2+}\right]_{i}}{\left[(\text { bipy }) H^{+}\right]_{i}^{3} \times\left[F e^{2+}\right]_{i}} \times \frac{\left[H^{+}\right]^{3}}{\left[K_{a}\right]^{3}} \tag{1}
\end{equation*}
$$

$\boldsymbol{R}_{5 / 6}$ is the ratio of the stability constants $\boldsymbol{K}_{(5)}$ and $\boldsymbol{K}_{(6)}$ of the ligands $\mathbf{5}$ and $\mathbf{6}$ (equation 2).

$$
\begin{equation*}
i=5,6 \Rightarrow \quad R_{5 / 6}=\frac{K_{5}}{K_{6}}=\frac{\left[(\text { bipy })_{3} F e^{2+}\right]_{5} \times\left[(\text { bipy }) H^{+}\right]_{6}^{3} \times\left[F e^{2+}\right]_{6}}{\left[(\text { bipy }) H^{+}\right]_{5}^{3} \times\left[F e^{2+}\right]_{5} \times\left[(\text { bipy })_{3} F e^{2+}\right]_{6}} \tag{2}
\end{equation*}
$$

The concentration of the complex $\left[(\text { bipy })_{3} \mathrm{Fe}^{2+}\right]_{i}(i=5,6)$ can be calculated from the ration of the $\mathrm{A} / \mathrm{A}_{\text {extr }}$ and the initial concentration of the ligand (or $\left.\mathrm{Fe}\left(\mathrm{BF}_{4}\right)_{2}\right)$ (equation 3).

$$
\begin{equation*}
\left[(\text { bipy })_{3} F e^{2+}\right]_{i}=\left(\frac{A}{A_{e x t r}}\right)_{i} \times C_{i}^{\left(b i p y y_{3} F^{2+}\right.} \tag{3}
\end{equation*}
$$

Where $A$ is the measured maximum absorbance and $A_{\text {extr }}$ is the extrapolated absorbance (see job's plots in Figures S3 and S4 and the reference 3). $C_{i}^{(b i p y)_{3} F e^{2+}}$ Represents the theoretical maximum concentration of the complex $\left[(\text { bipy })_{3} \mathrm{Fe}^{2+}\right]_{i}$.

The concentration of the free 2, $2^{\prime}$-bipy groups $\left[(\text { bipy }) H^{+}\right]_{i}$ and $\operatorname{iron}(\mathrm{II})\left[\mathrm{Fe}^{2+}\right]_{i}(i=5,6)$ can be calculated from the concentration of the complex $\left[(\text { bipy })_{3} \mathrm{Fe}^{2+}\right]_{i}(i=5,6)$ (equations 4 and 5).

$$
\begin{align*}
& {\left[F e^{2+}\right]=C_{i}^{F e^{2+}}-\left[(\text { bipy })_{3} F e^{2+}\right]_{i}}  \tag{4}\\
& {\left[(\text { bipy }) H^{+}\right]_{i}=3 C_{i}^{\text {Lig. }}-3\left[(\text { bipy })_{3} F e^{2+}\right]_{i}}
\end{align*}
$$

Where $C_{i}^{\text {Lig. }}$ and $C_{i}^{F e^{2+}}(i=5,6)$ are the initial concentration of the ligand (5 or $\left.\mathbf{6}\right)$ and $\mathrm{Fe}\left(\mathrm{BF}_{4}\right)_{2}$, respectively. Each ligand ( $C_{i}^{\text {Lig. }}$ ) provides three $2,2^{\prime}$-bipy moieties (bipy).

## Results are collected in table S1.

Table S1. The absorbances and concentrations [mM] for the calculations of $\boldsymbol{K}_{(\mathbf{5})}, \boldsymbol{K}_{(\mathbf{6})}$ and $\boldsymbol{R}_{(5 / 6)}$.

|  | $A_{\text {extr }}$ | $A$ | $\left[(\text { bipy })_{3} F e^{2+}\right]_{i}$ | $C_{i}^{F e^{2+}}$ | $C_{i}^{\text {Lig } .}$ | $\left[(\text { bipy }) H^{+}\right]_{i}$ | $\left[F e^{2+}\right]_{j}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{5}$ | 0.6026 | 0.5907 | 0.09890 mM | 0.1009 mM | 0.1015 mM | 0.007838 mM | 0.00199 mM |
| $\mathbf{6}$ | 0.8043 | 0.6772 | 0.11165 mM | 0.1327 mM | 0.1326 mM | 0.062863 mM | 0.02110 mM |

$c\left[H^{+}\right]=10^{-2,61} M \quad K_{a}=\frac{\left[2,2^{\prime} \text {-bipy }\right] \times\left[H^{+}\right]}{\left[2,2^{\prime}-\text { bipy } H^{+}\right]}=10^{-4,3} \mathrm{M}$
$\Rightarrow \frac{\left[H^{+}\right]^{3}}{\left[K_{a}\right]^{3}}=\frac{\left(10^{-2,61} M\right)^{3}}{\left(10^{-4,3} M\right)^{3}}=10^{5,07}$
$K_{(5)}=\frac{[0.09890]_{5}}{[0.007838]_{5}^{3} \times[0.00199]_{5}} \times \frac{10^{-3} M}{\left(10^{-3}\right)^{4} M} \times 10^{5.07}=10^{22.08} M^{-3}$
$K_{(6)}=\frac{[0.11165]_{6}}{[0.062863]_{6}^{3} \times[0.02110]_{6}} \times \frac{10^{-3} M}{\left(10^{-3}\right)^{4} M} \times 10^{5.07}=10^{18.39} M^{-3}$
$\log K_{(5)}=22.08$
$\log K_{(6)}=18.39$
$\log R_{(5 / 6)} \approx 3.69$

The competition experiment: Five stock solutions $\boldsymbol{a}-\boldsymbol{e}(8.855 \pm 0.003 \mathrm{mM})$ of each metal ion $\mathbf{M}^{2+}\left(\mathrm{Fe}^{2+}(\boldsymbol{a}), \mathrm{Ni}^{2+}(\boldsymbol{b}), \mathrm{Co}^{2+}(\boldsymbol{c}), \mathrm{Cu}^{2+}(\boldsymbol{d}), \mathrm{Zn}^{2+}(\boldsymbol{e})\right)$ were prepared from the sulphate salt (Table S2). Stock solutions $\boldsymbol{a}-\boldsymbol{e}(1.000 \mathrm{ml}$ of each) where then mixed to the six 20 ml flasks to obtain following mixtures: $\boldsymbol{a}, \boldsymbol{a}+\boldsymbol{b}, \boldsymbol{a}+\boldsymbol{c}, \boldsymbol{a}+\boldsymbol{d}, \boldsymbol{a}+\boldsymbol{e}$ and $\boldsymbol{b}+\boldsymbol{c}+$ $\boldsymbol{d}+\boldsymbol{e}$, followed by acidification with HAc $(0.400 \mathrm{ml}, 99 \%)$ and then dilution to the volume of $20 \mathrm{ml}\left(c\left[\mathbf{M}^{\mathbf{2}}\right]=0.4428 \pm 0.0004 \mathrm{mM}\right)$ (Table S3). Stock solution of $\mathbf{5}$ was prepared by dissolving $5(12.154 \mathrm{mg}, 0.00885 \mathrm{mmol})$ in $\mathrm{HAc}(0.400 \mathrm{ml})$ and diluting the solution to the volume of $20 \mathrm{ml}(c[5]=0.4427 \mathrm{mM})$. Stock solution of reference ligand 5,5'-dimethyl-2,2'-bipyridine (L) was prepared in a analogical manner ( 24.474 mg , $0.13284 \mathrm{mmol}, c[\mathbf{L}]=1.3284 \mathrm{mM}$ ) (Table S4). Twelve solution (six for $\mathbf{5}$ and another six for $\mathbf{L}$ ) for the UV-VIS spectroscopy were prepared by adding 1 ml of solution containing the mixture of metals (see table S 3 ), 1 ml of ligand solution ( $\mathbf{5}$ or $\mathbf{L}$ ) and diluted with 1 ml of 0.35 M HAc solution $\left(c[\mathbf{5}]=c\left[\mathbf{M}^{\mathbf{2 +}}\right]=c^{1} / 3[\mathbf{L}]=0.1476 \mathrm{mM}\right)$ (Table S5).

Table S2. The stock solutions.

## X-Ray crystallography

Suitable crystals of I, V (Figure S5) and VII (Figure S6) for the single crystal X-ray diffraction analyses were selected and analyses were performed by using a Bruker Kappa Apex II diffractometer with graphite-monochromatized $\operatorname{Mo}-\mathrm{K}_{\alpha}(\lambda=0.71073 \AA)$ radiation for I and VII, and $\mathrm{Cu}-\mathrm{K}_{\alpha}(\lambda=1.54184 \AA)$ radiation for $\mathbf{V}$. Collect software ${ }^{4}$ was used for the data collection and DENZO-SMN ${ }^{5}$ for the data reduction. The structures were solved by direct methods with $\operatorname{SIR} 97^{6}$ and refined by full-matrix least-squares methods with WinGX-software, ${ }^{7}$ which utilizes the SHELXL-97. ${ }^{8}$ All C-H hydrogen positions were calculated in the idealized positions by using a riding atom model after the anisotropic refinement of all non-hydrogen atoms of the structure. If possible, all $\mathrm{N}-\mathrm{H}$ hydrogens were located from the electron density map and refined with restrained bond distances using isotropic displacement parameters of $1.2 U_{e q}$ of the attached N -atom. Most of the $\mathrm{O}-\mathrm{H}$ hydrogens were located from the electron density map and refined as a rotating group by using the same (1.2 $U_{\text {eq }}$ ) isotropic displacement parameters. In case of VII, the water $\mathrm{O}-\mathrm{H}$ hydrogens could not be located from the electron density map. Detailed crystallographic data for $\mathbf{I}, \mathbf{V}$ and $\mathbf{V I I}$ is depicted in Table S6.

Figure S5 A view of the crystal structure of $\mathbf{V}$; solvent molecules and counter ions are omitted for clarity (a) and the top view of the complex (b) with the counter ions. Distances and angles for the six $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ H-bonds; 2.742(13) $\AA$ and $144.5^{\circ}$ [N8$\mathrm{H} \cdots \mathrm{O} 5 \mathrm{D}], 3.031(16)$ and 171.5 [N22-H $\cdots \mathrm{O} 5 \mathrm{~B}]$, 2.731(13) and 161.5 [N36-H $\cdots \mathrm{O} 1 \mathrm{E}]$, $3.000(13)$ and $155.9\left[\mathrm{~N} 43-\mathrm{H}^{\cdots} \mathrm{O}^{*} \mathrm{O}^{*}\right]$, 2.822(14) and 157.9 [N63-H $\left.\cdots \mathrm{O} 5 \mathrm{C}\right], 2.955(13)$ and $167.3[\mathrm{~N} 83-\mathrm{H} \cdots \mathrm{O} 4 \mathrm{~A}]$ (*another symmetrically equivalent site).

Figure S6 A view of the crystal structure of VII; solvent molecules and counter ions are omitted for clarity (a) and the top view of the complex (b) with the counter ions.
Distances and angles for the six $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and the two carboxyl H-bonds; 2.751(4) $\AA$ and $168.9^{\circ}[\mathrm{N} 11-\mathrm{H} \cdots \mathrm{O} 3 \mathrm{~A}], 2.755(4) \AA$ and $170.1^{\circ}\left[\mathrm{N} 25-\mathrm{H} \cdots \mathrm{O} 1 \mathrm{~A}^{*}\right]$, 2.768(4) $\AA$ and $170.5^{\circ}$ [N39-H $\left.\cdots \mathrm{O} 2 \mathrm{~A}^{*}\right], 2.947(6) \AA$ and $157.4^{\circ}$ [N43-H $\cdots \mathrm{O} 4 \mathrm{~B} *$ ], 2.993(5) $\AA$ and $162.5^{\circ}$ [N61-
$\left.\mathrm{H}^{\cdots} \mathrm{O}^{2} \mathrm{~B}^{*}\right], 2.983(6) \AA$ and $165.7^{\circ}[\mathrm{N} 79-\mathrm{H} 79 \cdots \mathrm{O} 2 \mathrm{~B}], 2.553(4) \AA$ and $163.1^{\circ}$ [O59$\left.\mathrm{H}^{\cdots} \mathrm{O}^{2} \mathrm{~A}^{*}\right], 2.504(5) \AA$ and $168.8^{\circ}\left[\mathrm{O} 78-\mathrm{H}^{\cdots} \mathrm{O} 3\right]$ (* another symmetrically equivalent site).
