Conditions: black, $[\beta\text{CD}]:[\text{Ce}(\text{IV})] = 0:1$; green, $[\beta\text{CD}]:[\text{Ce}(\text{IV})] = 1:1$; red, $[\beta\text{CD}]:[\text{Ce}(\text{IV})] = 4:1$.

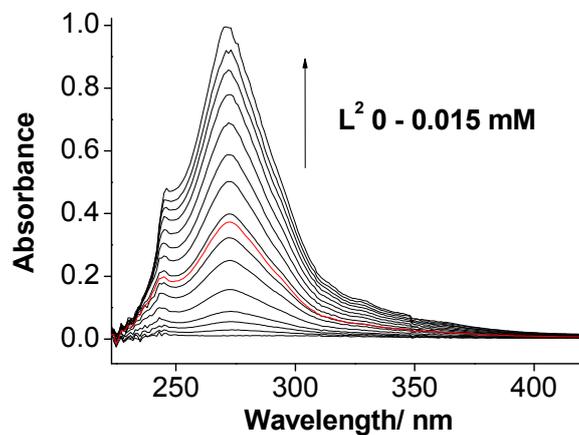

Fig. S5 UV-vis spectra at $298 \pm 0.1\text{K}$ of $2.5\ \mu\text{M}\ \text{Ce}(\text{NH}_4)_2(\text{NO}_3)_6$ at increasing concentrations of L^2 from 0 to 0.015 mM (black lines); the red line represents the free L^2 at 0.015 mM. Enhanced absorption observed for $\text{Ce}(\text{IV})\text{-L}^2$ compared with free L^2 approved coordination between L^2 and $\text{Ce}(\text{IV})$ ion.
