[†]All the rate constants (k_{obs}) are counting by considering the stoichiometric factors.
^aAt $I = 1.0 \text{ (NaCl) M}$.

Derivation of rate law:

$$K_1 = \frac{[2][H^+]}{[1]} \quad \text{OR} \quad [2] = \frac{K_1[1]}{[H^+]}$$

$$K_2 = \frac{\text{[Spin Adduct]}}{[2][NDS^{2-}]}$$

OR

$$[\text{Spin Adduct}] = K_2[2][NDS^{2-}] = \frac{K_1 K_2 [1][NDS^{2-}]}{[H^+]}$$

$$\text{Rate} = k_1[\text{Spin Adduct}] = \frac{k_1 K_1 K_2 [1][NDS^{2-}]}{[H^+]} \quad \dots\dots\dots (1)$$

Again, considering the stoichiometric factor

$$\text{Rate} = 2 k_{\text{obs}} \cdot [1] \quad \dots\dots\dots (2)$$

Comparing equation (1) and (2),

$$k_{\text{obs}} = \frac{0.5 k_1 K_1 K_2 [NDS^{2-}]}{[H^+]}$$
