## A. SYNTHESES AND CHARACTERIZATION OF 1a, 1b, and 2

A1. General Procedures, Starting Materials and Equipment. Unless specified otherwise, all operations were performed under an atmosphere of $99.5 \%$ argon further purified by passage through columns of activated BASF catalyst and molecular sieves. All connections involving the gas purification systems were made of glass, metal, or other materials impermeable to air. Solutions were transferred via stainless steel needles (cannulas) whenever possible. Standard Schlenk techniques were employed with a double manifold vacuum line. Both $\mathrm{CH}_{3} \mathrm{CN}$ and $\mathrm{CD}_{3} \mathrm{CN}$, as well as $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, were distilled over $\mathrm{CaH}_{2}$. Diethyl ether and THF were distilled from $\mathrm{Na} /$ benzophenone. Heptane and pentane were distilled from Na /benzophenone dissolved in a minimum amount of diglyme. DMSO was distilled over $\mathrm{P}_{2} \mathrm{O}_{5}$. Following purification, all solvents, including deuterated solvents, were stored under argon.

Infrared spectra were recorded on a PerkinElmer Spectrum 100 FTIR spectrometer with samples sealed in 0.1 mm NaCl cells or between NaCl disks. NMR samples were analyzed on Bruker Avance 400 or 500 spectrometers. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts are given with reference to residual solvent resonances relative to $\mathrm{SiMe}_{4} .{ }^{51} \mathrm{~V}$ NMR chemical shifts are referenced to neat $\mathrm{VOCl}_{3}$. A solution of $\left[\mathrm{Et}_{4} \mathrm{~N}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right]$ in $\mathrm{CD}_{3} \mathrm{CN}$ was used as an external ${ }^{51} \mathrm{~V}$ NMR reference $\left(\delta\left({ }^{51} \mathrm{~V}\right)=-1955.0 \mathrm{ppm}\right.$ vs. neat $\left.\mathrm{VOCl}_{3}\right)$. UV-Vis spectra were recorded in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ or $\mathrm{CH}_{3} \mathrm{CN}$ at $24^{\circ} \mathrm{C}$ using a CARY 100 spectrophotometer.

Cyclic voltammetry (CV) experiments on $c a .2 \times 10^{-3} \mathrm{M}$ solutions of $\mathbf{1 a}, \mathbf{1 b}$, and $\mathbf{2}$ in $\mathrm{CH}_{3} \mathrm{CN}$ were conducted at room temperature using an EPSILON (Bioanalytical Systems Inc., West Lafayette, IN) electrochemical workstation. The electrochemical cell was placed in an argon-filled Vacuum Atmospheres dry-box. Tetrabutylammonium hexafluorophosphate ( 0.1 M solution in $\mathrm{CH}_{3} \mathrm{CN}$ ) was used as a supporting electrolyte. Cyclic voltammograms were recorded at $22 \pm 2^{\circ} \mathrm{C}$ using a three component system consisting of a platinum working electrode, a platinum wire auxiliary electrode, and a glass encased non-aqueous silver/silver chloride reference electrode. The reference $\mathrm{Ag} / \mathrm{Ag}^{+}$electrode was monitored with the ferrocenium/ferrocene couple. IR compensation was achieved before each CV run by measuring the uncompensated solution resistance followed by incremental compensation and circuit stability testing. Background cyclic voltammograms of the electrolyte solution were recorded before adding the analytes. The half-wave potentials ( $E_{1 / 2}$ ) were determined as averages of the cathodic and anodic peak potentials of reversible/partially reversible couples and are referenced to the external $\mathrm{FcH}^{+} / \mathrm{FcH}$ couple. ${ }^{1}$

Melting points are uncorrected and were determined for samples in capillary tubes sealed under argon. Elemental analyses were carried out by Desert Analytics (now Columbia Analytical Services), Tucson, Arizona.

Compounds $\quad\left[\mathrm{Et}_{4} \mathrm{~N}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right],{ }^{2} \quad\left[\mathrm{Cp}_{2} \mathrm{Co}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right],{ }^{3} \quad \mathrm{~V}(\mathrm{CO})_{6},{ }^{4} \quad\left[\mathrm{Cp}_{2} \mathrm{Co}\right]\left[\mathrm{BF}_{4}\right],{ }^{5} \quad 1,4-$ $\mathrm{CNC}_{6} \mathrm{Me}_{4} \mathrm{NC}$, ${ }^{6}$ and CNXyl (Xyl $=2,6$-dimethylphenyl) ${ }^{7}$ were prepared according to literature procedures. Complex $\left[\mathrm{Et}_{4} \mathrm{~N}\right]\left[\mathrm{V}(\mathrm{CO})_{5}(\mathrm{DMSO})\right]$, generated in THF by the method of Rehder, ${ }^{8}$ was used in situ. Other reagents were obtained from commercial sources and used as received.

A2. Synthesis of 1a. A yellow solution of $\left[\mathrm{Et}_{4} \mathrm{~N}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right](0.3466 \mathrm{~g}, 0.9924 \mathrm{mmol})$ and DMSO ( $0.4 \mathrm{~mL}, 5.6 \mathrm{mmol}$ ) in 80 mL of THF was irradiated using a Hanovia Hg 450 W immersion lamp for 4 hrs at $22^{\circ} \mathrm{C}$ with stirring. 1,4-Diisocyanodurene $(0.0914 \mathrm{~g}, 0.4962$ mmol ) dissolved in 20 mL of THF was added to the above solution and the mixture was stirred for 15 hrs . Then, the reaction mixture was concentrated to about 20 mL and stirred for an additional 2-hour period. Pentane ( 30 mL ) was added to the reaction flask and the mixture was vigorously stirred for 30 min . An oily dark red precipitate formed, which was washed with toluene $(2 \times 20 \mathrm{~mL})$. The toluene washings were carefully removed via cannula. After addition of 50 mL of pentane with stirring, the solution/slurry was filtered. The filtercake was dissolved in THF. This THF solution was filtered; the filtrate was layered with 150 mL of pentane and stored at $-35{ }^{\circ} \mathrm{C}$ for 3 hrs . The magenta precipitate was filtered off, washed with pentane $(2 \times 10 \mathrm{~mL})$ and dried at $10^{-2}$ torr to provide $1 \mathrm{a}(0.2523 \mathrm{~g}, 0.3052 \mathrm{mmol})$ in a $62 \%$ yield as a free-flowing magenta solid. Mp 82-84 ${ }^{\circ} \mathrm{C}$. Anal. Calcd. for $\mathrm{C}_{38} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{O}_{10} \mathrm{~V}_{2}$ : C, $55.21 ; \mathrm{H}, 6.34 ; \mathrm{N}, 6.78$. Found: C, $54.18 ; \mathrm{H}, 6.30 ; \mathrm{N}, 7.14$. IR $\left(\mathrm{CH}_{3} \mathrm{CN}\right): v_{\mathrm{CN}} 2061 \mathrm{w}, \mathrm{v}_{\mathrm{CO}} 1951 \mathrm{~m}, 1831 \mathrm{vs} \mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}, 25^{\circ} \mathrm{C}$ ): $\delta$ $1.20\left(\mathrm{t}, 24 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{3},{ }^{3} J_{\mathrm{H}-\mathrm{H}}=7 \mathrm{~Hz}\right), 2.32\left(\mathrm{~s}, 12 \mathrm{H}, \mathrm{CH}_{3}\right), 3.16\left(\mathrm{q}, 16 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{3},{ }^{3} J_{\mathrm{H}-\mathrm{H}}=7\right.$ $\mathrm{Hz}) \mathrm{ppm} .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(125 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}, 25^{\circ} \mathrm{C}\right): \delta 7.7\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 16.4\left(\mathrm{CH}_{3}\right), 53.2$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$ ppm. ${ }^{51} \mathrm{~V}$ NMR ( $131.6 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}, 25^{\circ} \mathrm{C}$ ): $\delta-1903.9 \mathrm{ppm}$; two ${ }^{13} \mathrm{CO}$ satellite doublets of the relative intensities $4: 1$ were also observed at -1904.2 ppm with ${ }^{1} \mathrm{~J}\left({ }^{13} \mathrm{C}-{ }^{51} \mathrm{~V}\right)=$ 116.8 Hz and -1903.9 ppm with ${ }^{1} \mathrm{~J}\left({ }^{13} \mathrm{C}_{-}^{51} \mathrm{~V}\right)=167.5 \mathrm{~Hz}$, respectively, as well a $\mathrm{C}^{18} \mathrm{O}$ satellite singlet at -1904.0 ppm . UV-Vis $\left(\mathrm{CH}_{3} \mathrm{CN}, \lambda_{\text {max }}\left(\varepsilon \times 10^{-3} \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right), 2{ }^{\circ} \mathrm{C}\right)$ : 489 (1.02) nm .

A3. Synthesis of 1b from $\mathbf{V}(\mathbf{C O})_{6}$. A colourless solution of diisocyanodurene, 1,4$\mathrm{CNC}_{6} \mathrm{Me}_{4} \mathrm{NC}(0.0716 \mathrm{~g}, 0.3886 \mathrm{mmol})$, in 100 mL of heptane was added to a cold $\left(-70^{\circ} \mathrm{C}\right)$ canary yellow solution of hexacarbonylvanadium $(0)(0.1702 \mathrm{~g}, 0.7772 \mathrm{mmol})$ in 200 mL of heptane in the dark with stirring. The reaction mixture was stirred at $-70^{\circ} \mathrm{C}$ for 2 hours while acquiring a pale tangerine colour and then warmed to $0^{\circ} \mathrm{C}$. FTIR of the solution/slurry in the $v_{\mathrm{CN}}$ and $v_{\mathrm{CO}}$ regions indicated essentially complete consumption of the starting materials. Then, an orange-brown solution of cobaltocene ( $0.1470 \mathrm{~g}, 0.7772 \mathrm{mmol}$ ) in 20 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was transferred to the reaction mixture in one portion at $0^{\circ} \mathrm{C}$ and the mixture was vigorously stirred for 30 min . The resulting dark solid was filtered off, washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(100 \mathrm{~mL})$ and pentane ( 50 mL ), recrystallized from $\mathrm{CH}_{3} \mathrm{CN}^{2} \mathrm{Et}_{2} \mathrm{O}$, and dried at $10^{-2}$ torr to afford dark violet, nearly black, $\mathbf{1 b}(0.3020 \mathrm{~g}, 0.3198 \mathrm{mmol})$ in a $73 \%$ yield. Compound $\mathbf{1 b}$ decomposes without melting at $138^{\circ} \mathrm{C}$. Anal. Calcd. for $\mathrm{C}_{42} \mathrm{H}_{32} \mathrm{Co}_{2} \mathrm{~N}_{2} \mathrm{O}_{10} \mathrm{~V}_{2}$ : C, $53.41 ; \mathrm{H}$, 3.42; N, 2.97. Found: C, 52.89; H, 3.60; N, 3.38. IR $\left(\mathrm{CH}_{3} \mathrm{CN}\right)$ : $\mathrm{v}_{\mathrm{CN}} 2041 \mathrm{w}$ br, $\mathrm{v}_{\mathrm{CO}} 1926 \mathrm{~m}$ br, 1847 s sh, 1839 vs, $1824 \mathrm{~m} \mathrm{sh} \mathrm{cm}^{-1}$. UV-vis $\left(\mathrm{CH}_{3} \mathrm{CN}, \lambda_{\max }\left(\varepsilon \times 10^{-3} \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right), 24{ }^{\circ} \mathrm{C}\right): 484$ (3.23) nm.

A4. Cation metathesis $\mathbf{1 a} \rightarrow \mathbf{1 b}$. A mixture of cobaltocenium tetrafluoroborate ( 0.0818 $\mathrm{g}, 0.2963 \mathrm{mmol})$ and $\mathbf{1 a}(0.1225 \mathrm{~g}, 0.1482 \mathrm{mmol})$ was dissolved in 80 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The resulting solution was stirred at $22{ }^{\circ} \mathrm{C}$ for 48 h to form a dark violet precipitate. After addition of less than 100 mL of heptane, the solid was filtered off, washed with 50 mL of heptane, and dried at $10^{-2}$ torr. Recrystallization from $\mathrm{CH}_{3} \mathrm{CN} / \mathrm{Et}_{2} \mathrm{O}(20 / 150 \mathrm{~mL})$ followed by drying of the product at $10^{-2}$ torr afforded a $53 \%$ yield of $\mathbf{1 b}(0.0738 \mathrm{~g} 0.0781 \mathrm{mmol})$,
which was spectroscopically (FTIR, ${ }^{1} \mathrm{H}$ NMR) identical to bona fide $\mathbf{1 b}$ described above in section A3.

A5. Synthesis of 1b from [ $\left.\mathbf{C p}_{2} \mathbf{C o}\right]\left[\mathrm{V}(\mathbf{C O})_{6}\right]$. A solution of $\left[\mathrm{Cp}_{2} \mathrm{Co}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right](0.1573 \mathrm{~g}$, 0.3855 mmol ) and DMSO ( $0.2 \mathrm{~mL}, 2.8 \mathrm{mmol}$ ) in 80 mL of THF was irradiated using a Hanovia Hg 450 W immersion lamp for 4 h at $22^{\circ} \mathrm{C}$ with stirring. Then, the red-orange reaction mixture was concentrated to about 20 mL under vacuum. 1,4-Diisocyanodurene ( $0.0355 \mathrm{~g}, 0.1927 \mathrm{mmol}$ ) dissolved in 20 mL of THF was added to the above concentrated solution. The mixture was stirred for 10 hrs , concentrated to about 10 mL , and stirred for an additional 8 -hour period. An oily black precipitate formed. Pentane ( 30 mL ) was added to the reaction flask and the mixture was vigorously stirred for 30 min . Then, 20 mL of toluene was added with stirring, and the solution/slurry was allowed to settle. The solution was carefully removed by cannula, and the residue was washed with toluene $(2 \times 20 \mathrm{~mL})$. The resulting dark violet, nearly black solid was washed with 50 mL of pentane and then triturated with an additional 50 mL of pentane. Filtration followed by drying at $10^{-2}$ torr provided crude $\mathbf{1 b}$ as a dark violet powder. Recrystallization of this solid from $\mathrm{CH}_{3} \mathrm{CN}^{2} / \mathrm{Et}_{2} \mathrm{O}$ gave microcrystalline $\mathbf{1 b}(0.0572 \mathrm{~g}, 0.0606 \mathrm{mmol})$ in a $31 \%$ yield. The product was spectroscopically (FTIR, NMR) identical to bona fide 1b described above in section A3.

A6. Synthesis of 2. A colourless solution of 2,6-dimethylphenyl isocyanide ( 0.1970 g , 1.5019 mmol ), in 70 mL of heptane was added to a yellow-green solution of hexacarbonylvanadium( 0 ) ( $0.3325 \mathrm{~g}, 1.5183 \mathrm{mmol}$ ) in 100 mL of heptane at room temperature. The reaction mixture rapidly acquired a mustard colour. After stirring for 2 h , an orange-brown solution of cobaltocene $(0.3234 \mathrm{~g}, 1.7100 \mathrm{mmol})$ was added to the reaction mixture at $22^{\circ} \mathrm{C}$ to result in the formation of dark aqua-coloured slurry. This mixture was stirred for 1 hr and then filtered. The filter-cake was washed with heptane $(2 \times 30 \mathrm{~mL})$ and recrystallized from $\mathrm{THF} / \mathrm{Et}_{2} \mathrm{O}$ to afford microcrystalline dark turquoise (bluish green) 2 $(0.5425 \mathrm{~g}, 1.0610 \mathrm{mmol})$ in two crops in a $71 \%$ combined yield. Mp $104-106{ }^{\circ} \mathrm{C}$ (dec). Anal. Calcd. for $\mathrm{C}_{18} \mathrm{H}_{19} \mathrm{CoNO}_{5} \mathrm{~V}: \mathrm{C}, 56.38$; H, 3.75; N, 2.74. Found: C, 56.43; H, 4.01; N, 2.61. IR $\left(\mathrm{CH}_{3} \mathrm{CN}\right)$ : $v_{\mathrm{CN}} 2053 \mathrm{w}, v_{\mathrm{CO}} 1943 \mathrm{~m}, 1849 \mathrm{~s}$ sh, $1837 \mathrm{vs} \mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, $\mathrm{CD}_{3} \mathrm{CN}, 21{ }^{\circ} \mathrm{C}$ ): $\delta 2.36\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 5.35\left(\mathrm{~s}, 10 \mathrm{H}, \mathrm{C}_{5} H_{5}\right), 7.02\left(\mathrm{t}, 1 \mathrm{H}, p-\mathrm{H},{ }^{3} J_{\mathrm{H}-\mathrm{H}}=8 \mathrm{~Hz}\right)$, $7.05\left(\mathrm{~d}, 2 \mathrm{H}, m-\mathrm{H},{ }^{3} \mathrm{~J}_{\mathrm{H}-\mathrm{H}}=8 \mathrm{~Hz}\right) \mathrm{ppm} .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}, 21^{\circ} \mathrm{C}$ ): $\delta 19.1$ $\left(\mathrm{CH}_{3}\right), 88.9\left(\mathrm{C}_{5} \mathrm{H}_{5}\right), 126.7,128.6,134.4$ (aromatic $C$ ) ppm. UV-vis $\left(\mathrm{CH}_{3} \mathrm{CN}, \lambda_{\max }\left(\varepsilon \times 10^{-3} \mathrm{M}^{-}\right.\right.$ $\left.{ }^{1} \mathrm{~cm}^{-1}\right), 24^{\circ} \mathrm{C}$ ): 483 (1.75) nm.

## B. X-RAY CHRYSTALLOGRAPHIC CHARACTERIZATION OF 1b

## B1. Experimental

Black needle-shaped crystals of $\mathbf{1 b}$ were grown by layering $\mathrm{Et}_{2} \mathrm{O}$ over a nearly saturated solution of $\mathbf{1 b}$ in $\mathrm{CH}_{3} \mathrm{CN}$ at room temperature and then cooling the sample to $+4{ }^{\circ} \mathrm{C}$ for several days. All manipulations with the crystals prior to transfer to the goniometer were performed in argon atmosphere. A full hemisphere of diffracted intensities ( 185010 -second frames with an $\omega$ scan width of $0.30^{\circ}$ ) was measured for a single-domain specimen using graphite-monochromated MoK $\alpha$ radiation ( $\lambda=0.71073 \AA$ ) on a Bruker SMART APEX CCD Single Crystal Diffraction System. ${ }^{9}$ X-rays were provided by a fine-focus sealed x-ray tube operated at 50 kV and 30 mA . Lattice constants were determined with the Bruker SAINT software package using peak centers for 8659 reflections. A total of 41416 integrated reflection intensities having $2 \theta<60.20^{\circ}$ were produced using the Bruker program SAINT. ${ }^{10}$ The intensity data were corrected empirically for variable absorption effects using equivalent reflections. ${ }^{11}$ The Bruker software package SHELXTL Version 6.10 was used to solve the structure using "direct methods" techniques. All stages of weighted full-matrix least-squares refinement were conducted using $\mathrm{F}_{\mathrm{o}}{ }^{2}$ data with the SHELXTL software package. ${ }^{12}$ A region of the unit cell containing disordered solvent molecules of crystallization (presumably acetonitrile) was modeled using the Squeeze option in PLATON. ${ }^{13}$

The final structural model incorporated anisotropic thermal parameters for all nonhydrogen atoms and isotropic thermal parameters for all hydrogen atoms. The two crystallographically-independent methyl groups in the dianion were included in the structural model as rigid groups (using idealized $\mathrm{sp}^{3}$-hybridized geometry and a $\mathrm{C}-\mathrm{H}$ bond length of $0.98 \AA$ ) which were allowed to rotate about their C-C bonds in least-squares refinement cycles. The remaining hydrogen atoms were included in the structural model as idealized atoms (assuming $\mathrm{sp}^{2}$-hybridization of the carbon atoms and a C-H bond length of $0.95 \AA$ ). The isotropic thermal parameters of all idealized hydrogen atoms were fixed at values 1.2 (non-methyl) or 1.5 (methyl) times the equivalent isotropic thermal parameter of the carbon atom to which they are covalently bonded.

Thermal ellipsoid plots were made using ORTEP III program. ${ }^{14}$ The displacement ellipsoids are drawn at the $50 \%$ probability level. Crystal data, data collection, solution, and refinement information for $\mathbf{1 b}$ are summarized in Table S1. Tables S2 through S6 contain atomic coordinates, as well as metric and displacement parameters for $\mathbf{1 b}$.

Table S1. Crystal data and structure refinement for $\mathbf{1 b}$.

| Empirical formula | $\mathrm{C}_{42} \mathrm{H}_{32} \mathrm{Co}_{2} \mathrm{~N}_{2} \mathrm{O}_{10} \mathrm{~V}_{2}$ |

## C. DFT CALCULATIONS

## C1. Experimental

Density Functional Theory (DFT) calculations on 1,4-diisocyanodurene and 2,6dimethylphenyl isocyanide were performed using the Orca (v.2.8.0) program. ${ }^{15}$ Geometric optimizations were performed spin-restricted using the BP86 functional ${ }^{16}$ with a TZVP basis set. ${ }^{17}$ The resolution of identity approximation (RI) was used along with the SV/J auxiliary basis set. ${ }^{18}$ Single point energy calculations were performed using the B3LYP functional ${ }^{19}$ with a TZVP basis set to obtain orbital energies. Orbital pictures were produced using the Molekel (v.5.4.0.8) program with isodensity values set at $\pm 0.05 .{ }^{20}$ The following tables contain Cartesian coordinates for the optimized compounds.

Table S7. Cartesian coordinates $(\AA)$ for the optimized structure of 1,4-diisocyanodurene.

## D. FIGURES

Figure S1. Thermal ellipsoid plot for the cobaltocenium cations in $\mathbf{1 b}$ (all $\left[\mathrm{Cp}_{2} \mathrm{Co}\right]^{+}$cations are mutually symmetry equivalent).

Figure S2. Frontier molecular orbitals for 2,6-dimethylphenyl isocyanide (left) and 1,4diisocyanodurene (right).

Submitted to Dalton Trans.

Figure S3. UV-Vis spectra of $\mathbf{1 a}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (red) and $\mathrm{CH}_{3} \mathrm{CN}$ (black) at $24^{\circ} \mathrm{C}$.

Figure S4. UV-Vis spectra of $\mathbf{1 b}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (red) and $\mathrm{CH}_{3} \mathrm{CN}$ (black) at $24^{\circ} \mathrm{C}$.

Figure S5. UV-Vis spectrum of $\mathbf{2}$ in $\mathrm{CH}_{3} \mathrm{CN}$ at $24^{\circ} \mathrm{C}$.

Submitted to Dalton Trans.

Figure S6. Electronic absorption spectra (visible region) of [ $\left.\mathrm{Cp}_{2} \mathrm{Co}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right]$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (red) and $\mathrm{CH}_{3} \mathrm{CN}$ (black) at $24^{\circ} \mathrm{C}$. The vanadium-to-cobalt contact ion pair charge transfer occurs at $\lambda_{\text {max }}=620 \mathrm{~nm}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. ${ }^{21}$

Figure S7. ${ }^{51} \mathrm{~V}$ NMR ( $131.6 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}, 25^{\circ} \mathrm{C}$ ) spectrum of $\mathbf{1 a}$ in $\mathrm{CD}_{3} \mathrm{CN}$ at $25^{\circ} \mathrm{C}$ referenced to neat $\mathrm{VOCl}_{3}$. A very small peak at -1955.0 ppm corresponds to trace contamination of the sample with $\left[\mathrm{Et}_{4} \mathrm{~N}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right]$, which is a common and persistent impurity associated with photolytic substitution reactions of $\left[\mathrm{Et}_{4} \mathrm{~N}\right]\left[\mathrm{V}(\mathrm{CO})_{6}\right]$.
