Theoretical Calculations.

All calculations were carried out using DFT as implemented in Gaussian 09. We chose to use the popular B3LYP functional, which includes Becke's three-parameter hybrid functional combined with the Lee–Yang–Parr correction for correlation. The standard 6-31G(d,p) basis set are used for H, C, N, O, and P atoms, while the effective core potentials (ECPs) of Hay and Wadt are combined with double- ζ valence basis sets (LanL2DZ) for Iridium. All structures studied in this paper were optimized. And all of the structures of transition states were presented in Figures. When necessary, IRC (intrinsic reaction coordinate) calculations were performed. Frequency calculations at the same level of theory have also been calculated to identify all stationary points as minima (zero imaginary frequencies) or first-order saddle points (one imaginary frequency) and to provide free energies at 298.15 K and 1 atm pressure, which include entropic contributions by considering the vibrations, rotations, and translations of the structures.

Solvent effects have also been taken into consideration. Single-point calculations with self-consistent reaction field based on the integral equation formalism polarizable continuum model (IEFPCM) with UAKS radii and cavity-dispersion-solvent-structure terms in Truhlar and co-workers' SMD solvation model for water and acetonitrile were applied for all gas-phase optimized structures at B3LYP/6-311++G(d,p) level. For all cited energies, ZPE corrections were taken into account. The electrons were given an energy of zero that corresponds to zero cell potential ($U=0V$). In order to evaluate the direction and magnitude of the donor–acceptor interactions for some stationary points, natural bond orbital (NBO) analysis was also performed. The Los Alamos National Laboratory 2-Double-Zeta (LANL2DZ) basis set was used for the Iridium atom, and the other atoms were computed with 6-311++G(d,p) basis.
