### Calculation of H-H Bond Distances Using H-D Coupling

In complexes **18**, **7**+H<sub>2</sub> and **20** H-D the coupling constants observed were artificially small, likely a result of the formation of different isotopomers. Only those isotopomers containing H-D should exhibit coupling allowing a more precise H-D coupling constant to be determined. Using these values H-H distances can be calculated using the equation previously described by Morris.<sup>1</sup>

**Table S1** Calculation of J<sub>HDActual</sub> and H-H Bond Distances

Complex	J <sub>HDobs</sub> (Hz)	J <sub>HDActual</sub> (Hz)	H-H Distance (pm)
<b>18</b>	5.4	21.6	106
<b>7</b> +H <sub>2</sub>	7.3	29.2	93
<b>20</b>	7.4	29.6	93

### Calculation of H-H Bond Distances Using T<sub>1</sub> Values

As the relaxation of a hydride in rapid exchange with an H<sub>2</sub> ligand is known to affect the observed T<sub>1min</sub> value of a complex, Morris *et al.* have previously described a means to correct for this effect if the T<sub>1</sub> value for the hydride can be determined after the signal separates from the dihydrogen ligand (equation 1).<sup>2</sup>

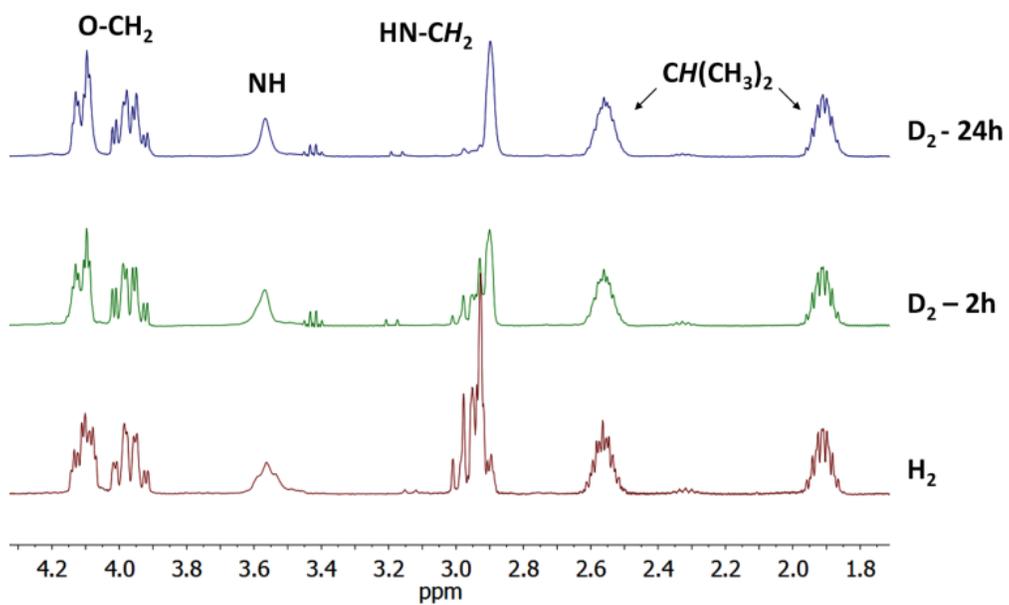

$$3/T_{1(\text{obs.})} = 2/T_{1(\text{H}_2)} + 1/T_{1(\text{H})} \quad \text{Equation 1}$$

As T<sub>1</sub> values of the hydride could not be obtained for any of the complexes described, such a correction could not be accurately made. However, metal hydrides are expected to have a T<sub>1(H)</sub> on the order of half a second,<sup>3</sup> and literature values for the hydride relaxation time in similar compounds have shown T<sub>1(H)</sub> times around 400 ms (corrected for a 600 MHz spectrometer).<sup>2</sup> Thus, hydride T<sub>1</sub> times of 200 ms, 400 ms and 1s were used so the H-H distance could be estimated to give an indication of where on the hydride-dihydrogen:trihydride continuum the complexes are. Notably, while the values are not exact, due to the nature of the relationship for the T<sub>1(H)</sub> time in equation 1, as the hydride relaxation time increases its effect is minimized and T<sub>1(obs)</sub> approaches T<sub>1(H<sub>2</sub>)</sub>.

**Table S2** Calculation of  $T_{1(H_2)}$  and H-H Bond Distances

Complex	$T_{1(\text{obs.})}$ (ms)	$T_{1(H)}$ (ms)	$T_{1(H_2)}$ (ms)	H-H Distance slow spinning $H_2$ (pm)	H-H Distance fast spinning $H_2$ (pm)
<b>18</b>	86	200	67	128	101
<b>18</b>	86	400	62	126	100
<b>18</b>	86	1000	59	125	99
<b>7+H<sub>2</sub></b>	39	200	28	110	87
<b>7+H<sub>2</sub></b>	39	400	27	110	87
<b>7+H<sub>2</sub></b>	39	1000	26	109	87
<b>19</b>	44	200	32	113	89
<b>19</b>	44	400	30	112	89
<b>19</b>	44	1000	30	111	88
<b>20</b>	55	200	40	117	93
<b>20</b>	55	400	38	116	92
<b>20</b>	55	1000	37	116	92
