

## Supporting Information

### Platinum(II) complex bearing deprotonated

### 2-(diphenylphosphino)benzoic acid for superior phosphorescence of monomers

Bin Zhang,<sup>a</sup> Lina Zhang,<sup>a,b</sup> Chunmei Liu,<sup>a</sup> Yanyan Zhu,<sup>a</sup> Mingsheng Tang,<sup>a</sup> Chenxia Du<sup>\*a</sup>  
and Maoping Song<sup>\*a</sup>

#### I. Experimental Section.

**General information and materials.** All commercial chemicals were used without further purification unless otherwise stated. The dry solvents were treated with an appropriate drying reagent and degassed prior to use. Unless otherwise specified, all air and moisture sensitive reactions were carried out under an argon atmosphere. Bubbling the samples with argon prior to emission spectra, quantum yield and lifetime determinations. The iridium dimer  $[(C^N)_2Ir(\mu-Cl)]_2$ <sup>1</sup> and platinum dimer  $[(C^N)Pt(\mu-Cl)]_2$ <sup>2</sup> ( $C^N$  = ppy) were synthesized according to literature method.

**Physical Measurements.** NMR spectra were obtained by using a Bruker DPX-400MHz spectrometer in DMSO-*d*<sub>6</sub>. Electrospray ionization (ESI) mass spectra were conducted in positive ion mode using a Bruker Esquire 3000 instrument (CH<sub>3</sub>OH was used as solvent). Elemental analysis for C, H, and N were determined with a Carlo-Erba1106 Elemental Analyzer. Absorption spectra were carried out on a Perkin-Elmer Lambda 900 spectrometer at room temperature. The steady-state emission was performed on a Jobin-Yvon-Horiba FluoroMax-4P spectrometer. The phosphorescent lifetimes of the complexes were obtained using a spectrophotometer from Edinburgh Instruments Ltd (FLS920). Solution quantum efficiency measurements were calculated by a comparison of the emission intensities (integrated areas) of a standard sample (Ir(ppy)<sub>3</sub>,  $\Phi = 0.40$ )<sup>3</sup> and the unknown sample at room temperature in a solution of dichloromethane. The relative method were based on equation  $\Phi_{unk}=\Phi_{std}((\eta_{unk})^2 A_{std} I_{unk})/((\eta_{std})^2 A_{unk} I_{std})$ , where the  $\Phi$  denotes the quantum yield,  $\eta$  is the refractive index, A is the absorbance, and I is the integrated area of the emission band, subscript unk is the sample and subscript std is the Ir(ppy)<sub>3</sub> reference.<sup>4</sup> The quantum efficiency of Pt-1 in solid state was obtained through an absolute method by employing

an integrating sphere.

**Synthesis of the Ir-1 Complex.** A mixture of cyclometalated Ir(III)  $\mu$ -chloro-bridged dimer (1.08g, 1.0 mmol),  $\text{HL}_1$  (0.76g, 2.5 mmol) and  $\text{Na}_2\text{CO}_3$  (1.06g, 10.0 mmol) in 2-ethoxyethanol (50 mL) was refluxed under a argon atmosphere for 16 h. After cooling to room temperature, the solvent was evaporated at low pressure. The obtained crude product was washed by water and then purified by column chromatography on silica gel using  $\text{CH}_2\text{Cl}_2/\text{EtOAc}$  as the eluent to afford a yellow product with a yield of 43% (0.69 g).  $^1\text{H}$  NMR (400 MHz,  $\text{DMSO}-d_6$ ):  $\delta$  8.29 (1H, d), 8.16-8.10 (2H, m), 8.05 (1H, d), 7.84-7.71 (5H, m), 7.52-7.38 (5H, m), 7.34-7.25 (3H, m), 7.06-7.01 (2H, m), 6.93-6.71 (7H, m), 6.52-6.50 (1H, m), 6.39-6.35 (2H, m), 6.78-6.75 (1H, m);  $^{31}\text{P}$  NMR (162 MHz,  $\text{DMSO}-d_6$ ):  $\delta$  -3.03; m/z:  $[\text{M}+1]^+$  calc 807.2, found 807.4; Anal. Calcd for  $\text{C}_{41}\text{H}_{30}\text{N}_2\text{O}_2\text{PIr}$ : C, 61.11; H, 3.75; N, 3.48. Found: C, 61.05; H, 3.76; N, 3.46.

**Synthesis of the Pt-1 Complex.** The cyclometalated platinum dimer (1.23 g, 1.6 mmol) reacted with  $\text{HL}_1$  (0.98 g, 3.2 mmol) and  $\text{Na}_2\text{CO}_3$  (1.69 g, 15.9 mmol) in 2-methoxyethanol (50 mL) at 130°C under an argon atmosphere for 16 h. After cooling to room temperature, the solvent was evaporated at low pressure. The obtained crude product was washed by water and then purified by column chromatography on silica gel using  $\text{CH}_2\text{Cl}_2/\text{EtOAc}$  as the eluent to afford a yellow product with a yield of 36% (0.75 g).  $^1\text{H}$  NMR (400 MHz,  $\text{DMSO}-d_6$ ):  $\delta$  9.02 (1H, t), 8.25-8.19 (3H, m), 7.75-7.51 (14H, m), 6.97-6.90 (2H, m), 6.53 (1H, t), 6.32-6.30 (1H, m);  $^{31}\text{P}$  NMR (162 MHz,  $\text{DMSO}-d_6$ ):  $\delta$  11.93; m/z:  $[\text{M}+1]^+$  calc 655.1, found 654.8; Anal. Calcd for  $\text{C}_{30}\text{H}_{22}\text{NO}_2\text{PPt}$ : C, 55.05; H, 3.39; N, 2.14; Found: C, 55.10; H, 3.36; N, 2.16.

**X-ray Crystallography.** Crystal diffraction data for Complexes Pt-1 and Ir-1 were measured on an Oxford Diffraction Xcalibur CCD diffractometer with graphite-monochromatized Mo-K $\alpha$  radiation ( $\lambda = 0.71073 \text{ \AA}$ ) at 291K using the  $\omega$ -scan technique. Programs CrysAlisPro was employed for data collection and data reduction.<sup>5</sup> The structures were solved by direct methods, and the non-hydrogen atoms were refined anisotropically by full-matrix least-squares method on  $\text{F}^2$  using the SHELXTL-97 program.<sup>6</sup> Calculated hydrogen positions were input and refined in a riding manner along with the attached carbons. Complete crystal structure results of the complexes as CIF files including bond lengths, angles, and atomic coordinates are available as Supporting Information.

**Computational Methodology.** Calculations on electronic singlet and triplet states of the studied

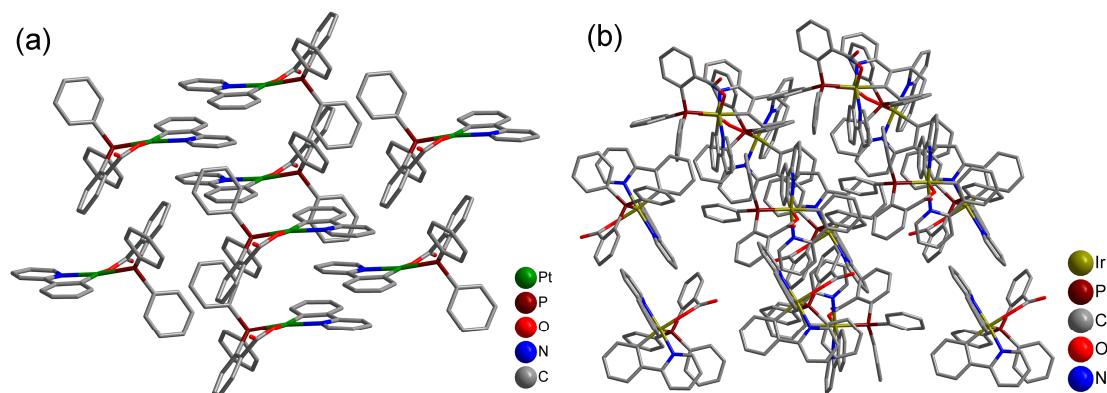

complexes (Ir-1 and Pt-1) were carried out using the density functional theory (DFT) with the B3LYP hybrid functional.<sup>7</sup> Restricted and unrestricted formalisms were adopted in the singlet and triplet geometry optimization, respectively. TDDFT was used to calculate singlet and triplet excited state energies on the basis of the optimized structures. The basis set used for C, H, N, O and P atoms was 6-311G++(d, p) while effective core potentials with a LANL2DZ basis set was employed for the Ir or Pt atom. The solvent effect of CH<sub>2</sub>Cl<sub>2</sub> was taken into consideration using the integral equation formalism (IEF) version of the polarizable continuum model (PCM) with the dielectric constant of dichloromethane ( $\epsilon = 8.93$ ).<sup>8</sup> All computations described here were performed by using the Gaussian 09 package.<sup>9</sup>

**Device Fabrication and Characterization.** The OLED was fabricated by vacuum deposition of the materials at 10<sup>-5</sup> Pa onto ITO-coated glass substrates. Prior to the deposition of organic layers, the ITO surface was cleaned through ultrasonication sequentially with deionized water, methanol and acetone, followed by the treatment with UV-ozone. The organic layers were deposited thermally at a rate of 0.1 nm/s at the base pressure < 7×10<sup>-5</sup> Pa. Subsequently, LiF was deposited at 0.02 nm/s and then capped with Al (ca. 0.5 nm/s) by shadow masking without breaking the vacuum. Current-voltage-light intensity (*I-V-L*) and EL spectra were measured and recorded by using a Keithley 2000 digital multimeter and ST-900M spectrometer luminance meter.

## II. Characterization

**Table S1** Crystal data and details of data collection and refinement.

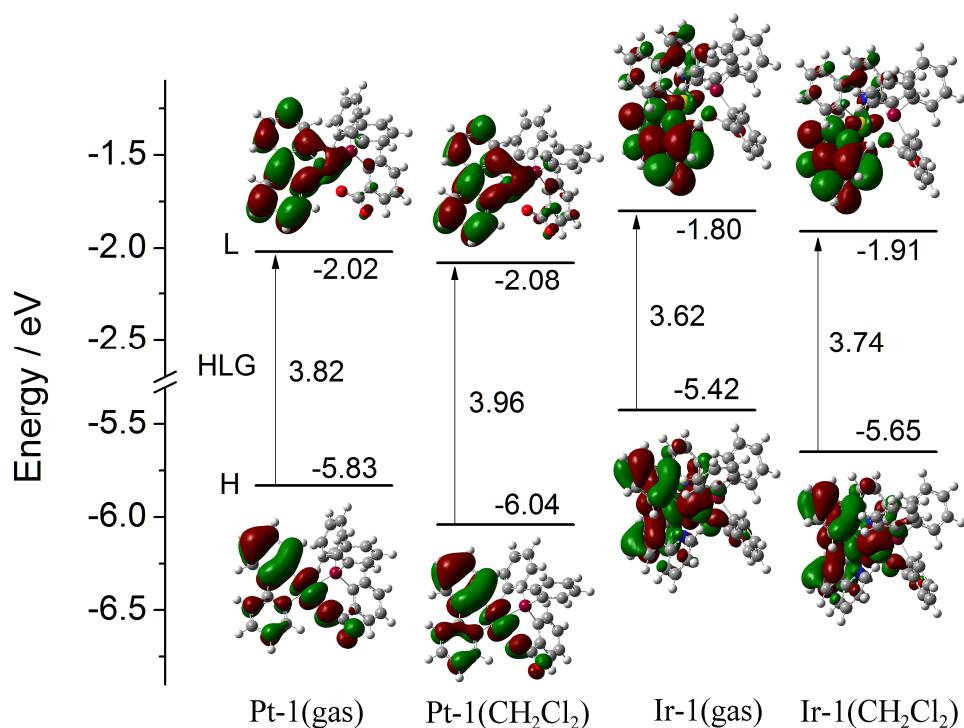

Compound reference	Pt-1	Ir-1
Chemical formula	C <sub>30</sub> H <sub>22</sub> NO <sub>2</sub> PPt•H <sub>2</sub> O	C <sub>41</sub> H <sub>30</sub> IrN <sub>2</sub> O <sub>2</sub> P•CH <sub>2</sub> Cl <sub>2</sub>
