1. Experimental details

The preparation of the tris ringed analogues of **1a** and **1d** (**4a** and **4d**) was burdened with isolation and purification problems and as such are not presented in this work (as well as the final longer complexes **7a** and **7d**). Nevertheless, the numbering was maintained to improve ease of comparison between the prepared analogues.

The preparation of the intermediaries (**2b-c** and **3b-c**) is described next. The method used for the synthesis of these compounds was already described on the main article and follows the Sonogashira-Hagihara coupling¹⁻¹⁰.

1.1. 1,4-dimethoxy-2,5-bis(4-bromophenylethynyl)benzene, **2b**

1,4-dimethoxy-2,5-diethynylbenzene (**1b**, 400 mg, 2.1 mmol), [PdCl₂(PPh₃)₂] (75 mg, 0.01 mmol), CuI (40 mg, 0.02 mmol), NEt₃ (20 mL), THF (20 mL), triphenylphosphine (28 mg, 0.01 mmol) and 1-bromo-4-iodobenzene (1.276 g, 4.5 mmol. Obtained a white powder (442 mg, 53.3 %).

¹H NMR (400 MHz, CDCl₃): δ 3.90 (*s*, 6H, OCH₃), 7.02 (*s*, Ar-*H*, central ring) 7.42 (*d*, 4H, Ar-*H* outer ring, J_{H,H} = 8.68 Hz), 7.49 (*d*, 4H, Ar-*H* outer ring, J_{H,H} = 8.60 Hz) ppm.

1.2. 1,4-diethoxy-2,5-bis(4-bromophenylethynyl)benzene, **2c**

1,4-diethoxy-2,5-diethynylbenzene (**1c**, 876 mg, 4.1 mmol), [PdCl₂(PPh₃)₂] (143 mg, 0.2 mmol), CuI (77 mg, 0.41 mmol), NEt₃ (20 mL), THF (20mL) and 1-bromo-4-iodobenzene (3.471 g, 12.3 mmol. Obtained a white powder (816 mg, 38.1 %).

¹H NMR (400 MHz, CDCl₃): δ 1.47 (*t*, 6H, OCH₂CH₃), 4.11 (*q*, 4H, OCH₂CH₃), 7.01 (*s*, Ar-*H*, central ring) 7.40 (*d*, 4H, Ar-*H* outer ring, J_{H,H} = 8.48 Hz), 7.49 (*d*, 4H, Ar-*H* outer ring, J_{H,H} = 8.73 Hz) ppm;

1.3. 1,4-dimethoxy-2,5-bis((4-trimethylsilylethynylphenyl)ethynyl)benzene, **3b**

1,4-dimethoxy-2,5-bis(4-bromophenylethynyl)benzene (**2b**, 3 g, 6 mmol), [PdCl₂(PPh₃)₂] (424 mg, 0.6 mmol), CuI (23 mg, 1.2 mmol), NEt₃ (30 mL), THF (30 mL) and trimethylsilylacetylene (1.31 g, 13.3 mmol. Obtained a yellow powder (1.16 g, 38.3 %).

^1H NMR (400 MHz, CDCl_3): δ 0.26 (*s*, 18H, $\text{Si}(\text{CH}_3)_3$), 3.90 (*s*, 6H, OCH_3), 7.02 (*s*, Ar-*H*, central ring) 7.44 (*d*, 4H, Ar-*H* outer ring, $J_{\text{H,H}} = 8.32$ Hz), 7.49 (*d*, 4H, Ar-*H* outer ring, $J_{\text{H,H}} = 8.32$ Hz) ppm;

1.4. 1,4-diethoxy-2,5-bis((4-trimethylsilylethynylphenyl)ethynyl)benzene, 3c
1,4-diethoxy-2,5-bis(4-bromophenylethynyl)benzene (**2c**, 1.165 g, 2.22 mmol), $[\text{PdCl}_2(\text{PPh}_3)_2]$ (78 mg, 0.11 mmol), CuI (42 mg, 0.22 mmol), NEt_3 (30 mL), THF (30 mL) triphenylphosphine (58 mg, 0.22 mmol) and trimethylsilylacetylene (655 mg, 6.67 mmol). Obtained a yellow powder (667 mg, 53.7 %).

^1H NMR (400 MHz, CDCl_3): 0.26 (*s*, 18H, $\text{Si}(\text{CH}_3)_3$), δ 1.48 (*t*, 6H, OCH_2CH_3), 4.11 (*q*, 4H, OCH_2CH_3), 7.01 (*s*, Ar-*H*, central ring) 7.44 (*d*, 4H, Ar-*H* outer ring, $J_{\text{H,H}} = 8.52$ Hz), 7.47 (*d*, 4H, Ar-*H* outer ring, $J_{\text{H,H}} = 8.08$ Hz) ppm;

2. Characterization

2.1. Absorption spectra

Table S. 1. Selected values for maximum the absorption peaks and their respective molar extinction coefficients for the free ligands (**1a-d**, **4b-c**), the palladium rods (**6a-d**, **7b-c**) and the free Pd complex (**5**).

[#]Distances of minor component in brackets

Fig. S. 35. Two Mercury¹¹ views of molecule **6c**. The view on the left shows the molecule along Pd–Pd axis with central phenylene placed in vertical orientation. It illustrates the almost co-planar behavior of Pd coordination plane and central aryl ring. Inside view (on the right) of the molecule, the central phenylene is drawn horizontal.

Fig. S. 36. A packing diagram of **6c** (viewed along the *a*-axis) shows side-by-side pairs, which are actually forming an infinite chains along the *a*-axis. The molecule in asymmetric unit is emphasized (ball-and-stick), and hydrogen atoms are removed for clarity.

Fig. S. 37. A view from **6c**, which illustrates the packing short contacts found by Mercury¹¹ potentially influencing the ethoxy group orientations. Only two types of contacts were found and involved both methylene protons of ethoxy group: the potentially attractive C–H···Cl interaction (C···Cl 3.70 Å, H···Cl 2.80 Å, C–H···Cl 153°) and weakly repulsive H···H contact (H···H 2.35 Å). Still, they may bend the ethoxy groups out of the plane of core aryl ring.

Fig. S. 38. ORTEP¹² plots of major (above) and minor (below) components of **7c**, showing the different spatial orientation of chlorines and -P(Et)₃ groups (ellipsoid probability 50 %).

Fig. S. 39. Two Mercury¹¹ views of the major component of **7c** with central phenyl placed in horizontal orientation. The view on the left is showing the molecule along Pd–Pd axis and illustrating the almost perpendicular direction of Pd–P bonds. On the right, there is a side view with better outlook of the different orientation of aromatic moieties.

Fig. S. 40. A packing diagram of **7c**, where the molecule in asymmetric unit is emphasized (ball-and-stick). The molecules are forming laminar structure where every second sheet is showing a different orientation of molecules. The disorder and hydrogen atoms are removed for clarity.
