The data for structure **7b** are not changed after final refinements.

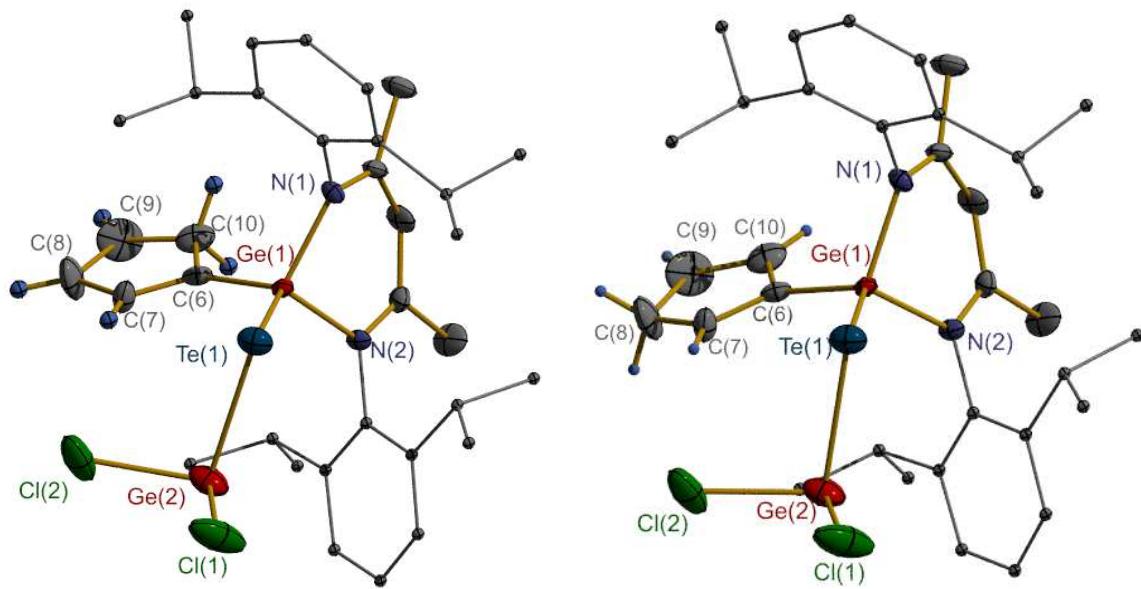

## II. Crystal structures of Cp-bonded compounds **1**, **4** and **7**

**Figure 1s.** X-ray crystal structure of **1**. Thermal ellipsoids are drawn at 50% probability level. H atoms at the Cp group are enhanced for clarity.

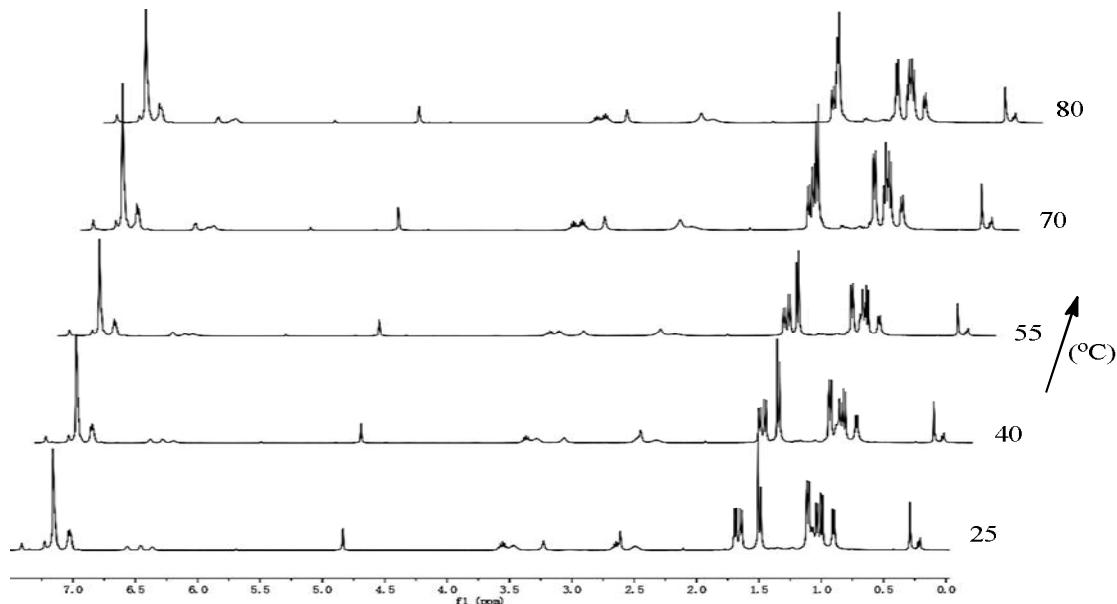

**Figure 2s.** X-ray crystal structures of **4** with two different hydrogen addition modes over the Cp ring corresponding to isomeric structures **4a** (left) and **4b** (right) shown in the text. Thermal ellipsoids are drawn at 50% probability level.

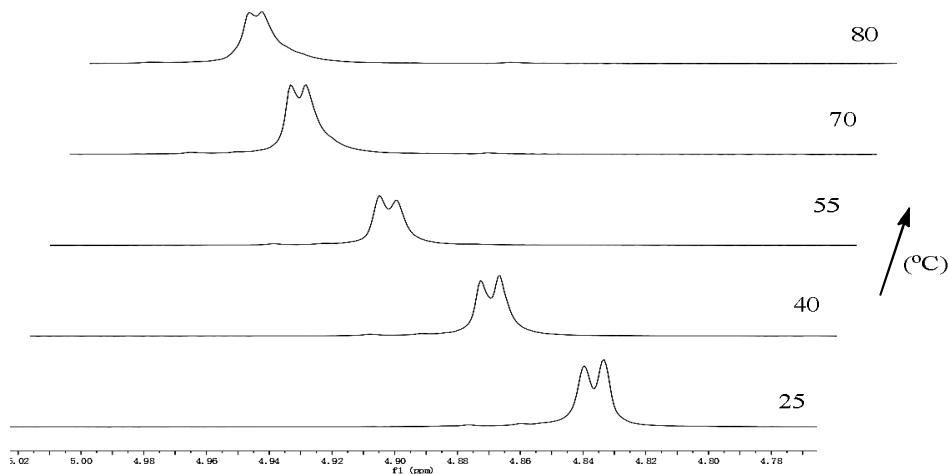

**Figure 3s.** X-ray crystal structures of **7** with two different hydrogen addition modes over the Cp ring corresponding to isomeric structures **7a** (left) and **7b** (right). Thermal ellipsoids are drawn at 50% probability level.

### III. Variable temperature (25–80 °C) $^1\text{H}$ NMR spectral studies of compound **4**

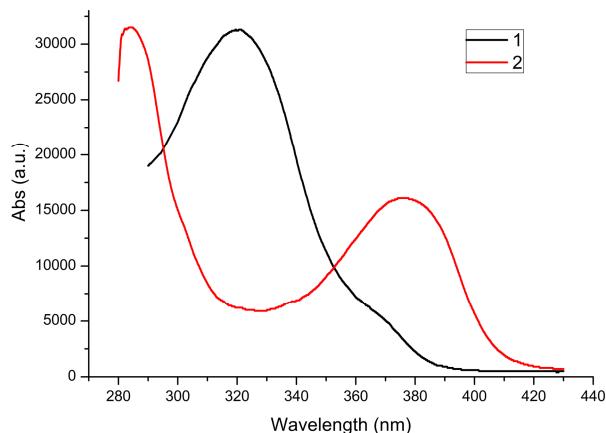

**Figure 4s.** Exhibition of a series of  $^1\text{H}$  NMR spectra of compound **4** recorded in  $\text{C}_6\text{D}_6$  at elevated temperatures.

**Figure 5s.** Exhibition of the enhanced resonances for the L ligand backbone  $\gamma$ -CH proton of compound **4** at  $\delta$  4.77–5.02 ppm in Figure 4s.

#### IV. UV-vis spectra of compounds **1** and **2**

**Figure 6s.** UV-vis spectra of compounds **1** (black,  $\lambda_{\max}$  (peak), 320, 366 nm) and **2** (red,  $\lambda_{\max}$  (peak), 287, 344 nm) recorded in toluene at room temperature ( $1 \times 10^{-5}$  mol/L).

#### IV. DFT calculations

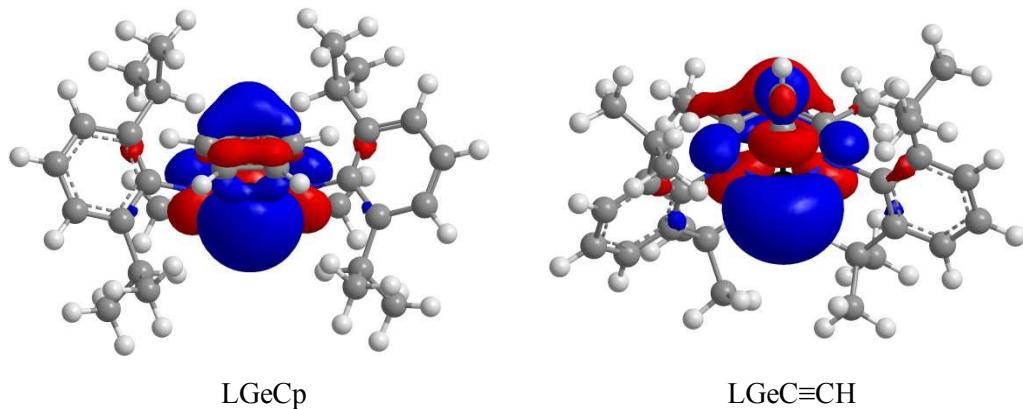

**Computational details:** All quantum-chemical calculations were carried out by using the Gaussian 09 program.<sup>1</sup> Geometry optimization for compound LG<sub>n</sub>R (R = Cp, C≡CH) was performed by using B3LYP/6-31+G(d)<sup>2-6</sup> and that for LG<sub>n</sub>(Te)R (R = Cp, C≡CH) was adopted on Stuttgart RSC 1997 ECP (to simplify the calculation, we use the H group instead of the Fc and Ph group).<sup>7</sup> Vibrational frequencies were calculated to ensure the optimized structure. Charge analyses were performed by using the natural bond orbital (NBO) program.<sup>8</sup> Computationally, it seems too difficult to directly calculate the enthalpies of reaction of LG<sub>n</sub>R with Te to form germanetellurone (eq (1)) because Te is

used as a solid powder. But, the bond disassociation energy (BDE) of Ge=Te could be calculated on considering the Te atom (the standard enthalpy value, 47.1 kcal/mol, has been experimentally determined<sup>9</sup>) according to eq (2) and (3).

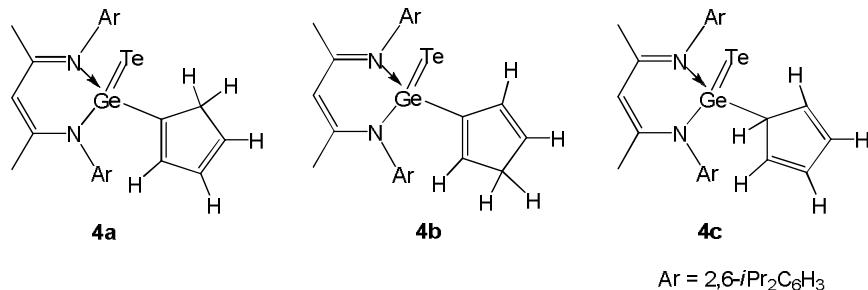

$$\Delta\text{H}_{\text{rxn}} = \Delta\text{H}_{\text{LGe(Te)R}} - \Delta\text{H}_{\text{LGeR}} - \Delta\text{H}_{\text{Te atom}} \quad (3)$$

$$\Delta\text{H}_{\text{rxn}} = \Delta\text{H}_{\text{Ge=Te}} + \Delta\text{H}_{\text{f}}^{\circ}(\text{Te atom}) \quad (4)$$

**Figure 7s.** HOMO orbital picture of LGeR

**Scheme 1s.** Three possible isomeric structures of compound **4** (Relative energies (kcal/mol), −2.5 for isomer **4a**, −1.0 for **4b**, and 0.0 for **4c**)

**Table 3s.** NBO analysis for LGeR ( $\text{L} = \text{HC}[\text{C}(\text{Me})\text{N}-2,6\text{-}i\text{Pr}_2\text{C}_6\text{H}_3]_2$ )

R	NBO Charge of Ge	Characteristics of lone pair of Ge		
		Occupation	Composition (%)	
			s	p
Cp	+1.047	1.967	86.5	13.5
$\text{C}\equiv\text{CH}$	+0.983	1.943	77.5	22.5

**Table 4s.** NBO analysis of LGe(Te)R ( $\text{L} = \text{HC}[\text{C}(\text{Me})\text{N}-2,6\text{-}i\text{Pr}_2\text{C}_6\text{H}_3]_2$ )

R	NBO charge		HOMO-LUMO gap (eV)	Characteristics of the Ge–Te bond				
	Ge	Te		Occupation	Contributions (%)	Composition (%)		
						s	p	d
Cp	+1.385	-0.543	2.73	1.932	Ge: 51.2	44.3	55.3	0.4
					Te: 48.8	11.1	88.9	0.0
C≡CH	+1.280	-0.454	2.80	1.944	Ge: 54.7	51.4	48.3	0.3
					Te: 45.3	10.6	89.4	0.0

**Table 5s.** Calculated enthalpies for reactions of LGeR with Te to LGe(Te)R

R	Bond disassociation energy (Ge=Te, kcal/mol)	ΔH <sub>rxn</sub> (kcal/mol)
Cp	47.1	0.0
C≡CH	50.2	-3.1
