b)

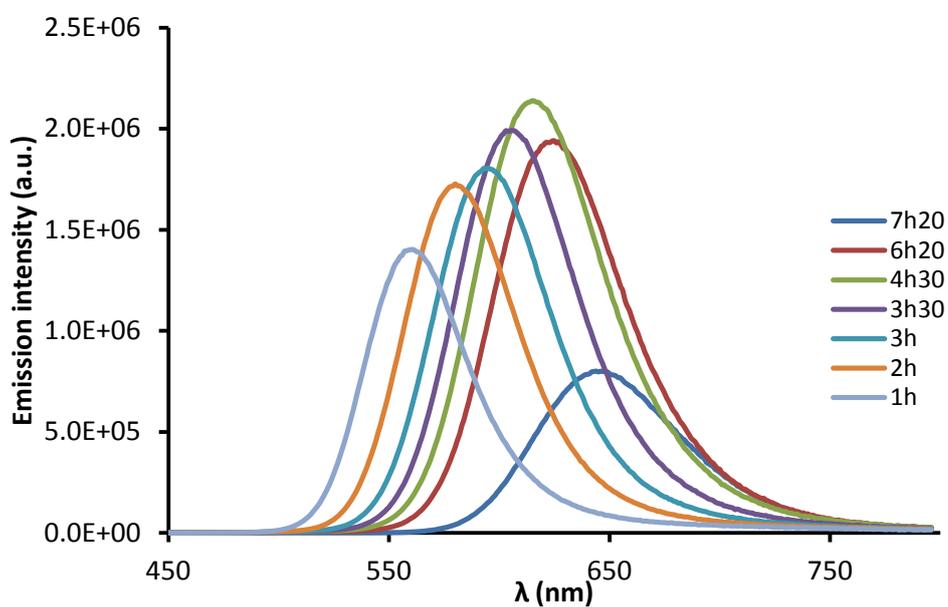

Figure S1: Temporal evolution of the UV-Vis spectra (a) and the corresponding emission spectra (upon excitation at 430 nm) (b) upon refluxing at 100°C the reaction mixture in a 4:0.5:4 Cd:Te:GSH stoichiometry.

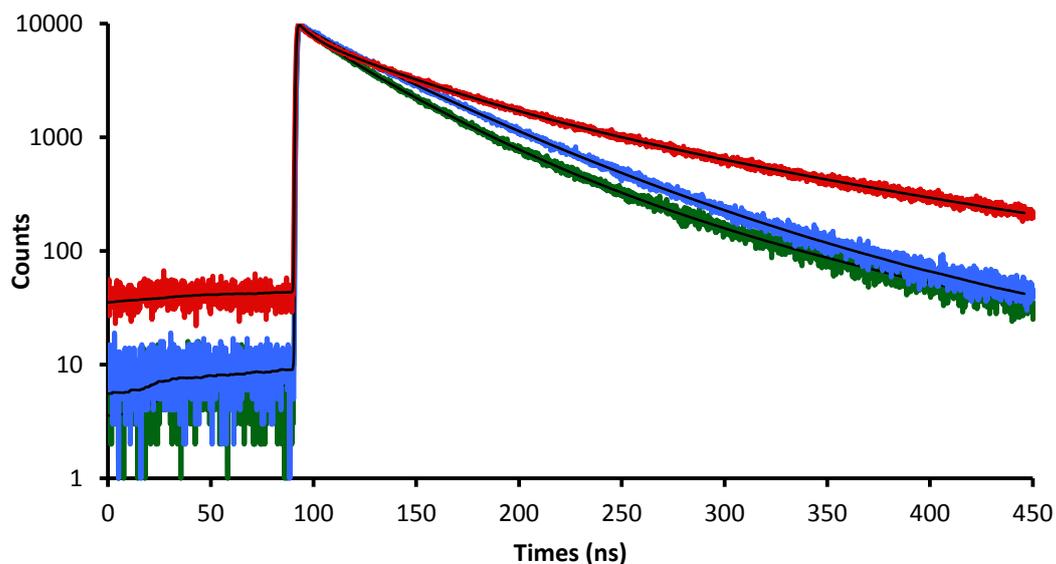

Figure S2: Time-resolved luminescence decay profiles of **QD540** (green), **QD600** (blue), **QD650** (red) in 0.01 M TRIS-HCl pH 7.4, $\lambda_{\text{ex}} = 370$ nm and $\lambda_{\text{em}} = 550$ nm and the corresponding fitting according to the values given in the text (back).

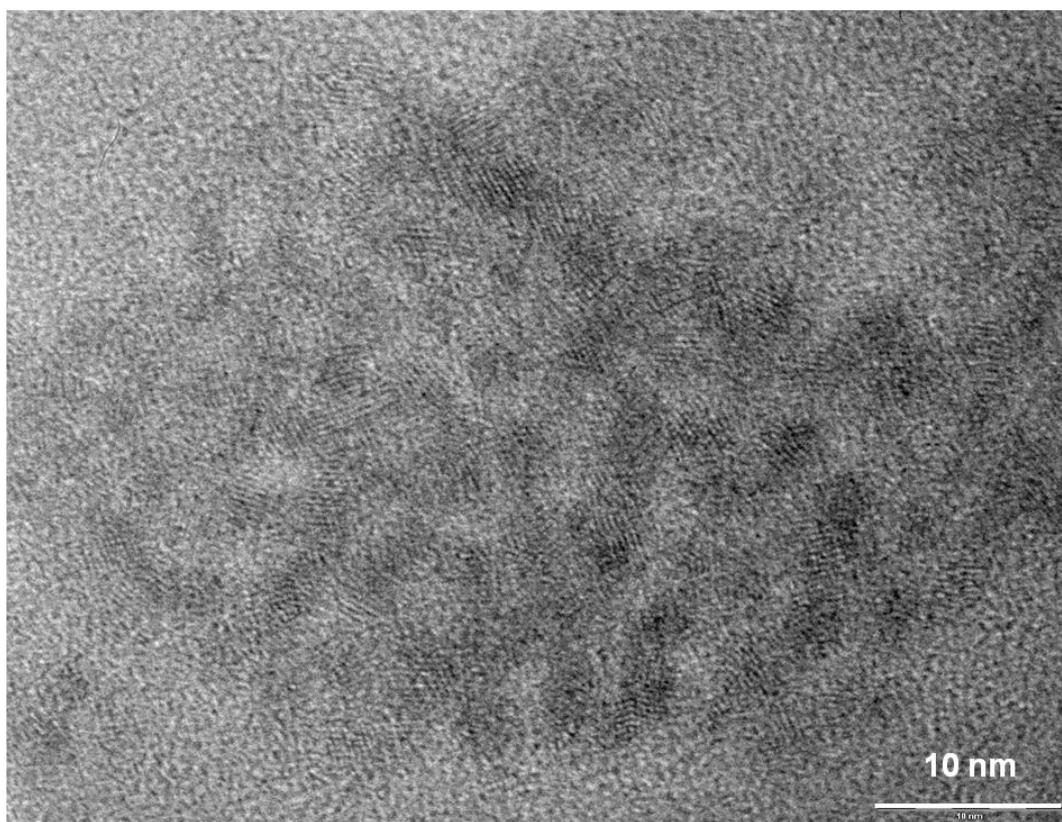

Figure S3: TEM image of **QD540**.

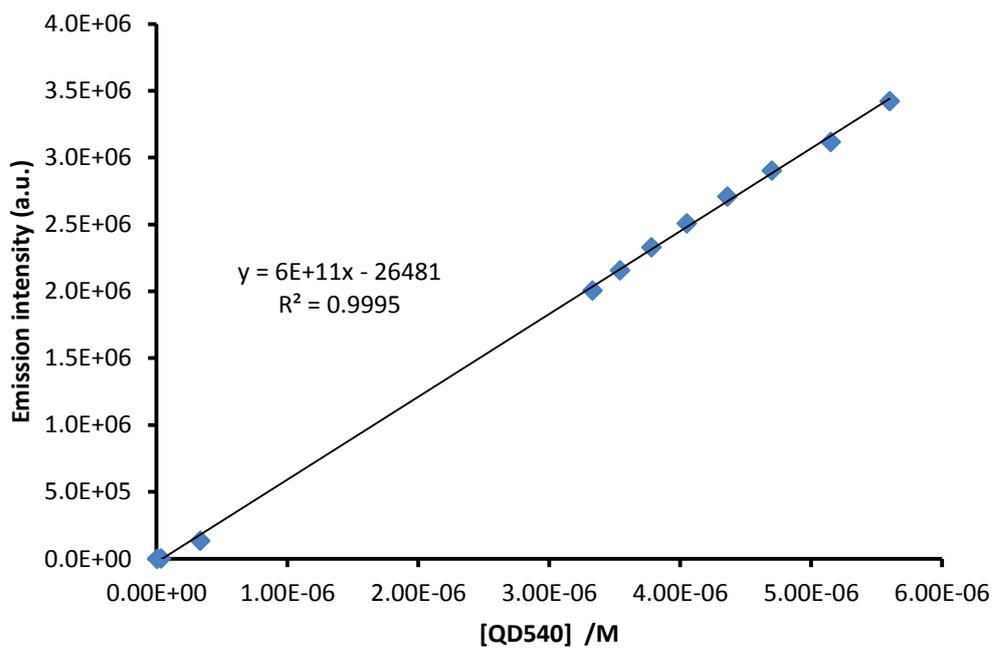

Figure S4: Emission intensity of **QD540** in TRIS/HCl 0.01M, pH 7.3 ($\lambda_{\text{ex}} = 430$ nm, $\lambda_{\text{em}} = 540$ nm) as a function of the concentration.

Approximation of the area covered by the GSH from a space filing MM2 model (ChemBio3D Ultra):

The required space for one GSH molecule on the surface of the QD was estimated from a space-filing MM2 model, in which the surface of the CdTeS quantum dot was modelled as a CdS cluster. The area covered by the ligand was approximated modelled as a conical form, with maximum height z_{max} and radius r .

$$z_{max} = \sqrt{(a^2 - r^2)} = 9.59 \text{ \AA}$$
$$A_{Ligand} = \pi r^2 = 77.0 \text{ \AA}^2$$

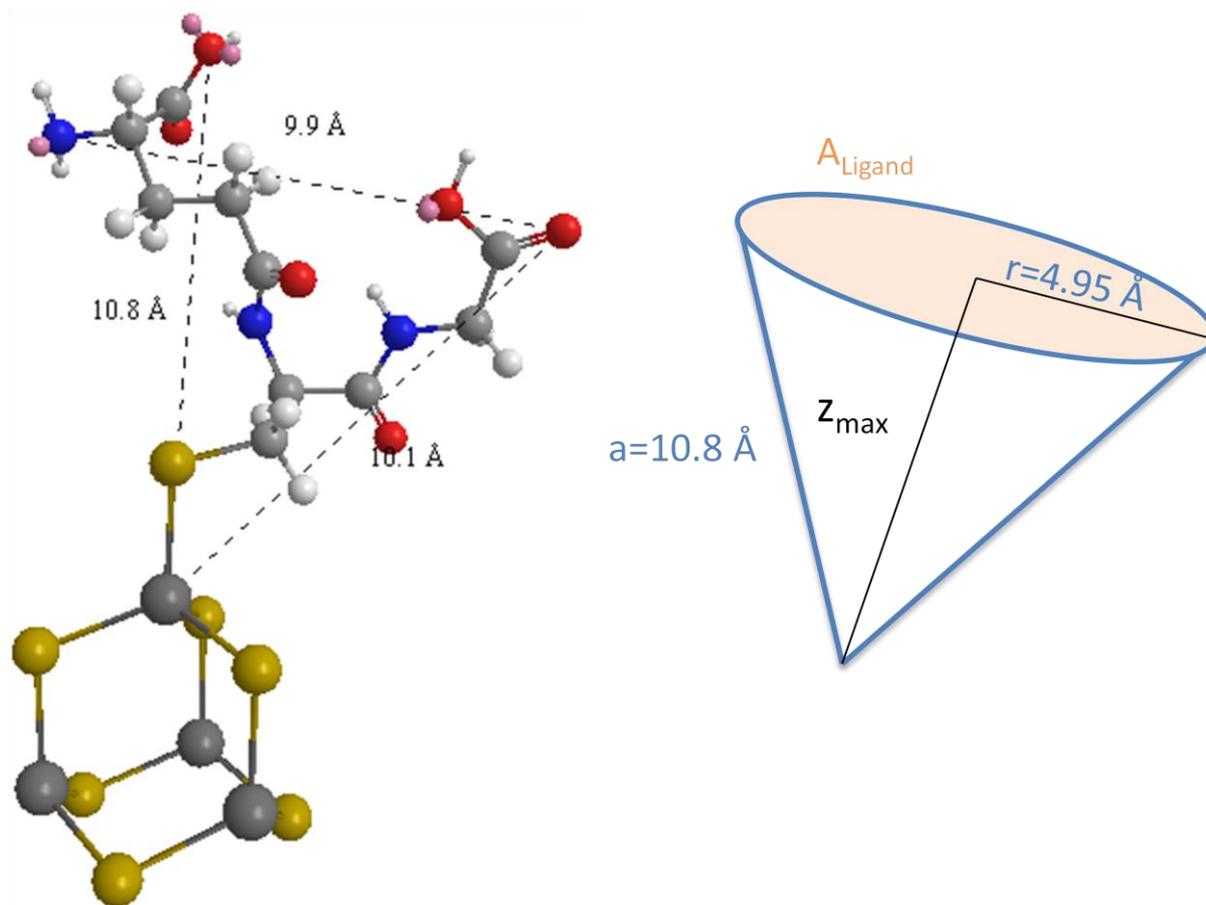

Figure S5: Approximation of the area covered by the GSH from a space filing MM2 model (ChemBio3D Ultra).

Table S1 Optical properties as well as chemical formulae of the CdTe_xS_y-GSH QDs at seven different reaction times and the corresponding density (ρ), diameters (D , T_h = obtained from Equation 3 and Exp = measured by TEM), volumes (V), as well as their molecular weights: MW (total molecular weight), MW_{core} (of the CdTe_xS_y core only) and total number of GSH per QD.

	Rq (%)	D _{Th} (nm)	FWH M	Em	T (min)	V _{Th} (nm ³)	ρ (kg/m ³)	GSH (mmol)	Chemical Formula	MW _{core} (g/mol)	MW (g/mol)

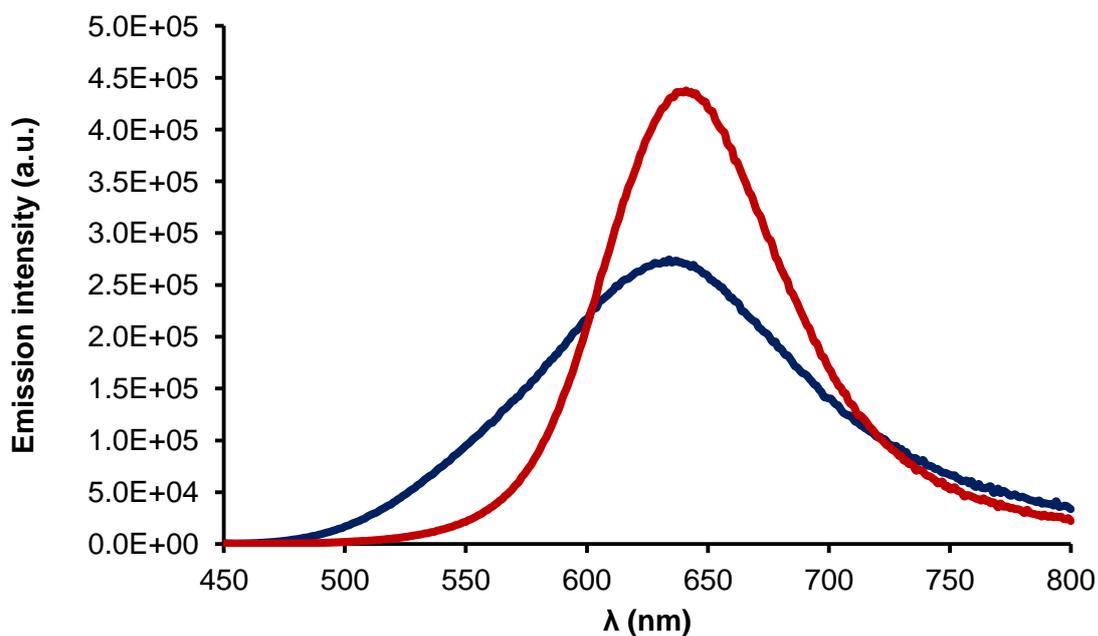

Figure S6: Emission spectra of quantum dots emitting at 636 nm before (blue) and after addition of GSH at room temperature (red, Citrate buffer, pH 8.5).

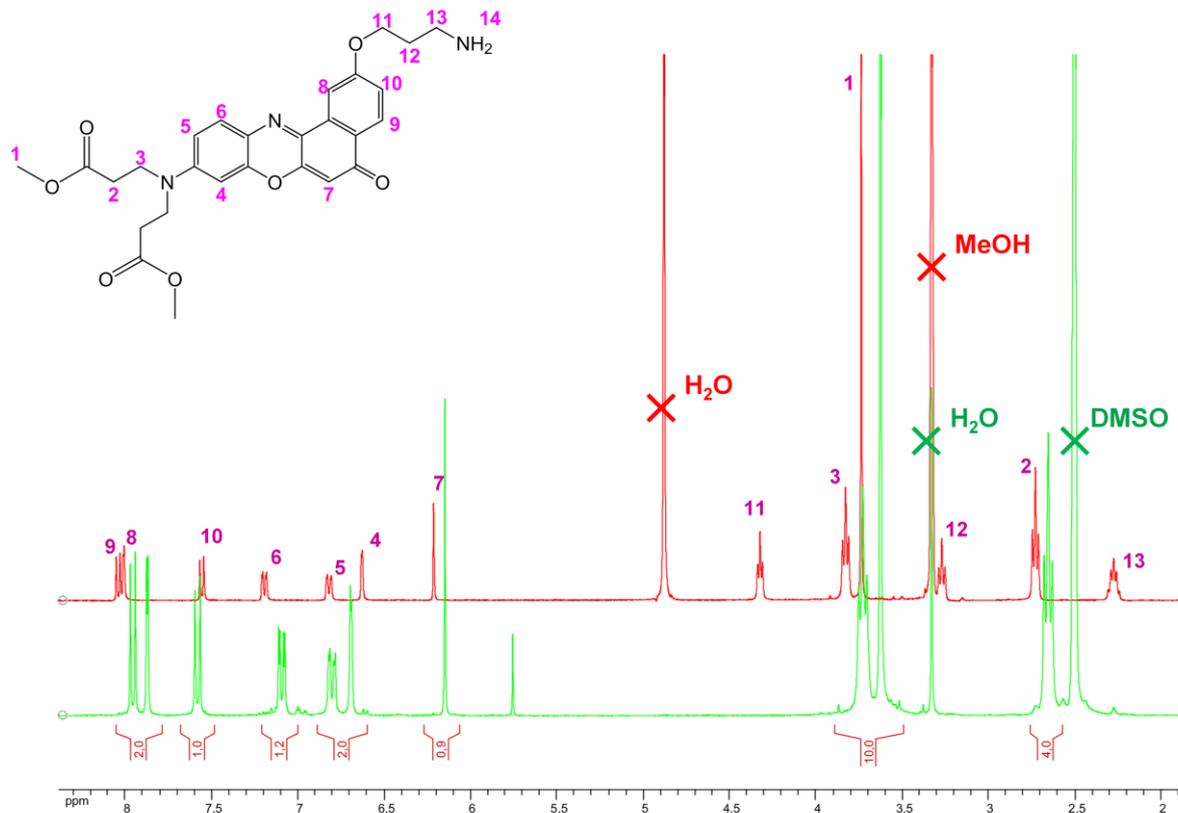

Figure S7: ^1H NMR spectrum of functionalized Nile-Red dyes (**1** in d_6 -DMSO, green and **3** in MeOD, red), 300 MHz.

Calculation of the Dye/QD ratios of QD-NR1, QD-NR2, QD-NR3, QD-NR4, QD-NR5, and QD-NR6 from their UV-absorption spectra:

The UV-absorption spectra ($A(\lambda)$) of the conjugated QDs have been fitted to a linear combination of the absorption of the Nile-Red ($A_{NR}(\lambda)$) and of the QD540 ($A_{QD}(\lambda)$):

$$A(\lambda) = a A_{NR}(\lambda) + b A_{QD}(\lambda)$$

The corresponding Dye and QD concentrations were obtained from the populations a and b , by taking into account the respective extinction coefficients, *i.e.* 16600 L. mol⁻¹.cm⁻¹ for the dye at 535 nm and 70 130 L. mol⁻¹.cm⁻¹ for the QD 540 at 400 nm.

Values are summarized in Table S1.

<i>Sample</i>	<i>Eq.</i>	<i>b</i>	<i>a</i>	<i>[QD]</i>	<i>[NR]</i>	<i>[NR]/[QD]</i>
QD-NR1	5	1.68	0.18	9.60616E-06	7.67711E-06	0.79918599
QD-NR2	9	3.11	0.55	1.77828E-05	2.34578E-05	1.31912799
QD-NR3	13	2.5	0.49	1.42949E-05	2.08988E-05	1.46197756
QD-NR4	18	2.2	0.45	1.25795E-05	1.91928E-05	1.5257187
QD-NR5	23	2.16	0.46	1.23508E-05	1.96193E-05	1.58850548
QD-NR6	37	2.09	0.52	1.19505E-05	2.21783E-05	1.85584497

Table S2: Factors a and b , and corresponding NR and QD concentrations as well as NR/QD ratios for **QD-NR1, QD-NR2, QD-NR3, QD-NR4, QD-NR5, and QD-NR6** upon addition of 5 to 3 eq. of Nile-Red dye.

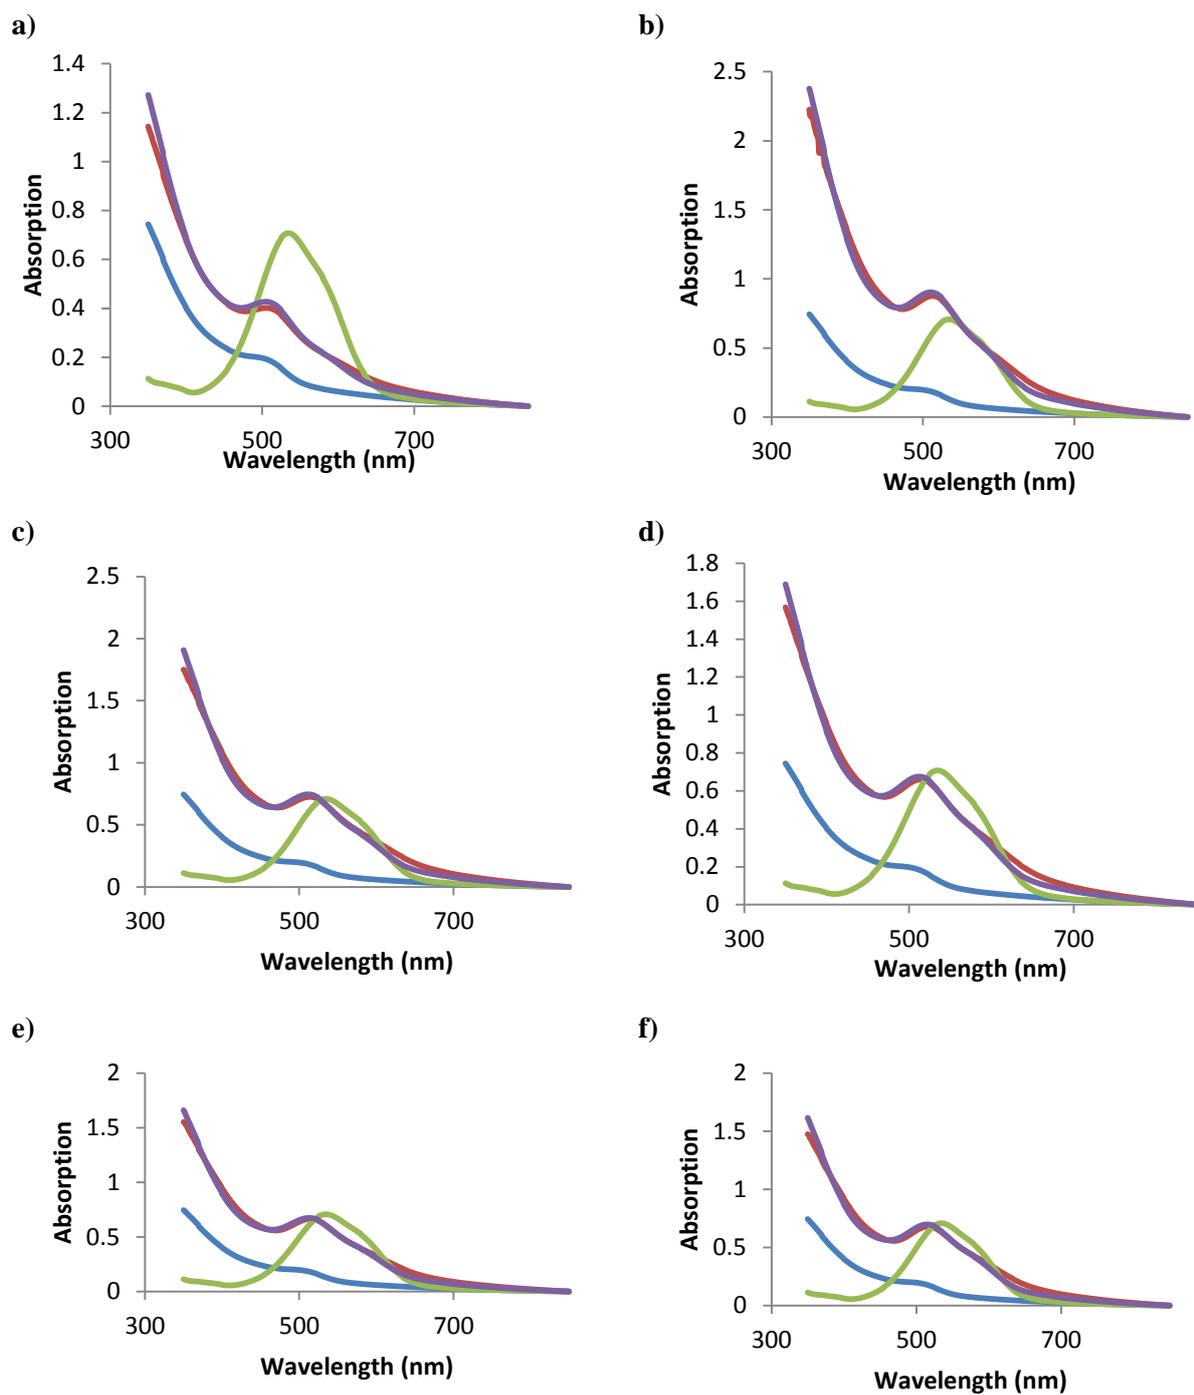

Figure S8: Experimental absorption spectra of Nile-red (green), QD540 (blue) and for conjugated QDs (red) with increasing dye/QD molar ratio as well as calculated spectra (purple) : a) QD-NR1, b) QD-NR2, c) QD-NR3, d) QD-NR4, e) QD-NR5, and f) QD-NR6.

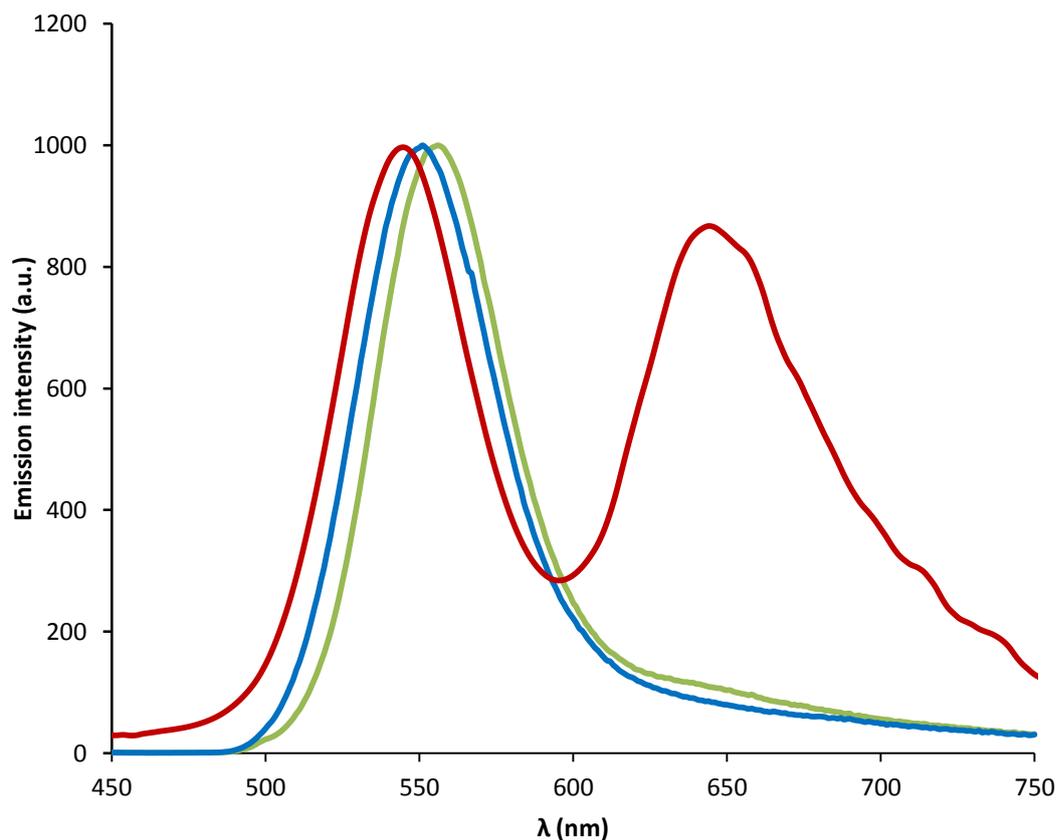

Figure S9: Normalized emission spectra of unconjugated QDs in absence of Nile-Red (blue), after mixing with of 23 equivalents of Nile-Red (green) and of conjugated QDs (NR/QD = 2.40, red), 0.01 M TRIS-HCl pH 7.4, $\lambda_{\text{ex}} = 375$ nm.

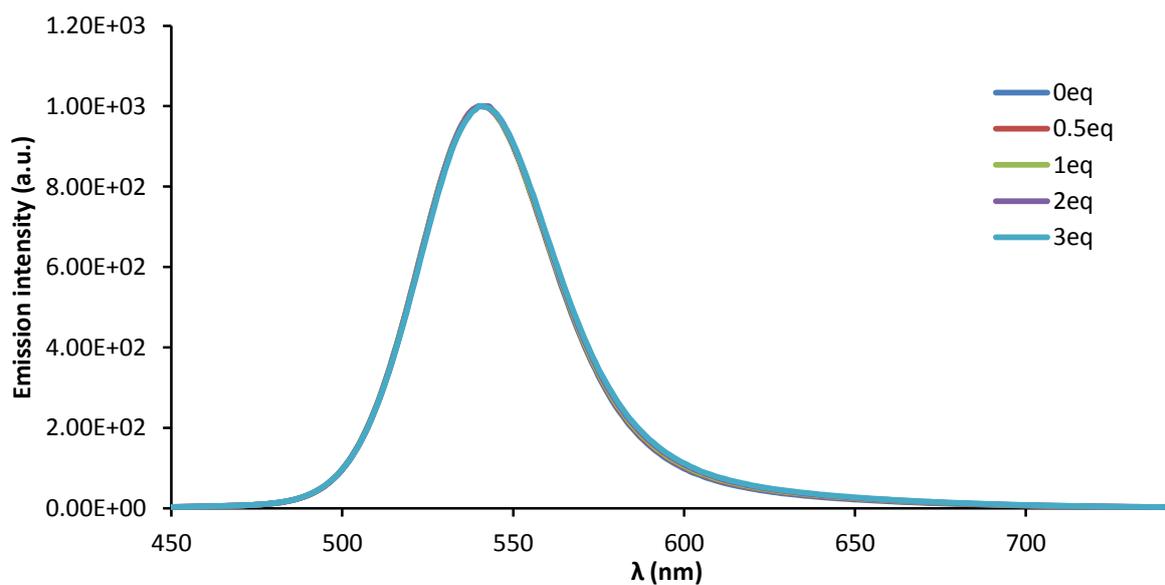

Figure S10: Normalized emission spectra of **QD540** (blue) and after mixing with of 0, 0.5, 1, 2 and 3 equivalents of Nile-Red in 0.01 M TRIS-HCl pH 7.4, $\lambda_{\text{ex}} = 375$ nm.

Background FRET theory and equations

The overlap integral $J(\lambda)$ between the QDs emission spectrum and the Nile Red absorption spectrum has been calculated according to Equation (S1) and amounts to $1.27 \times 10^{15} \text{ M}^{-1} \text{ cm}^{-1} \text{ nm}^4$:

$$J(\lambda) = \int_0^{\infty} F_D(\lambda) \varepsilon_A(\lambda) \lambda^4 d\lambda \quad (\text{S1})$$

where $F_D(\lambda)$ is the normalized emission of the donor (QD) and $\varepsilon_A(\lambda)$ is the absorption coefficient of the acceptor (Nile Red) at wavelength λ .

The Förster radius R_0 (nm), *ie.* the distance at which the efficiency of the FRET is 50%, could be calculated from the value of $J(\lambda)$ and from the value of the NHS-activated QDs (**QD540** in presence of NHS/EDCI) quantum yield ($\phi_D = 0.24$) by Equation (S2):

$$R_0^6 = 8.79 \times 10^{-5} n_r^{-4} \phi_D \chi^2 J(\lambda) \quad (\text{S2})$$

where ϕ_D is the quantum yield of the donor in the absence of acceptor, χ^2 is the orientation factor of the donor and acceptor dipoles (assumed to be equal to 2/3 in the case of dynamic averaging of the donor and acceptor dipoles within the donor lifetime),¹ n_r is the refractive index of the solution (e.g., $n_r = 1.33$ for water), N_{Av} is Avogadro's number.

The energy transfer efficiencies have been calculated from the variations of the intensity of the QDs according to Equation (S3):

$$E_{FRET} = 1 - \frac{I_{DA}}{I_D} \quad (\text{S3})$$

where I are the intensities (I) of the donor in absence of acceptor (X_D) and for the donor-acceptor pair (X_{DA}).

The distance between the donor and the acceptor, r can be obtained from Equation (S4):

$$E_{FRET} = \frac{nR_0^6}{nR_0^6 + r^6} \quad (\text{S4})$$

for n donor-acceptor pairs with a Förster radius R_0 separated by a distance r .
