### General Experimental Procedure and quantum yield calculation:

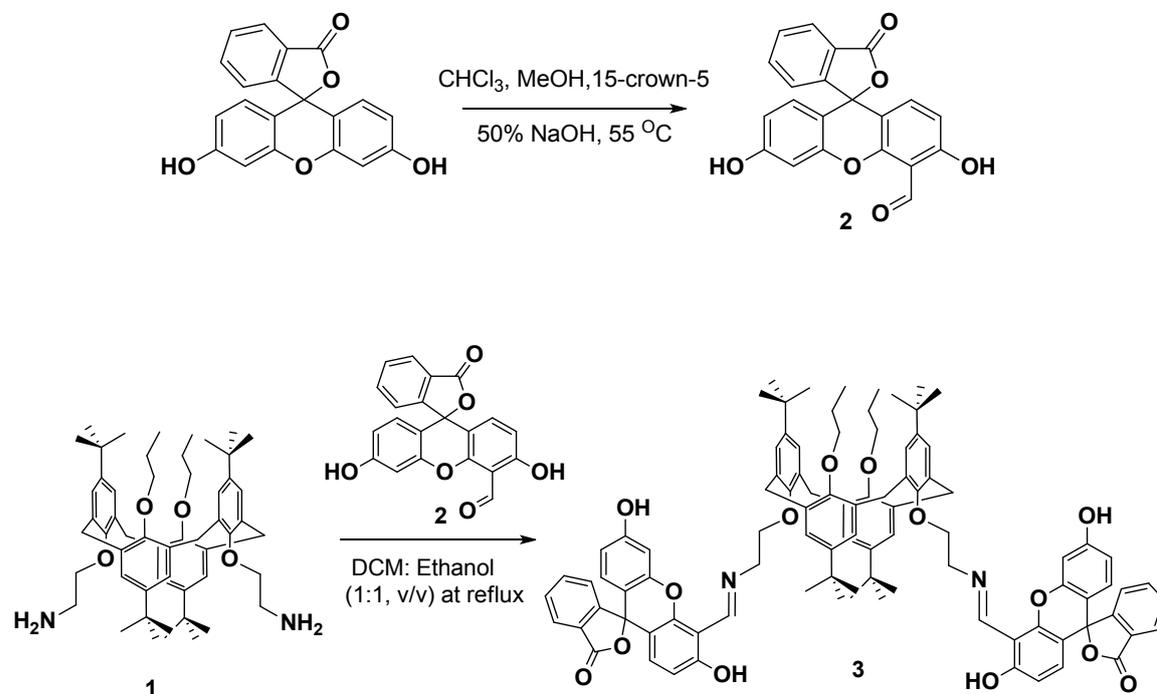

All reagents were purchased from Aldrich and were used without further purification. Acetonitrile (AR grade) was used to perform analytical studies. UV-vis spectra were recorded on a SHIMADZU UV-2450 spectrophotometer, with a quartz cuvette (path length, 1 cm). The cell holder was thermostatted at 25 °C. The fluorescence spectra were recorded with a SHIMADZU 5301 PC spectrofluorimeter. <sup>1</sup>H was recorded on a Bruker-AVANCE-II FT NMR-AL 500 MHz spectrophotometer using CDCl<sub>3</sub>, DMSO-d<sub>6</sub> as solvent and tetramethylsilane SiMe<sub>4</sub> as internal standards. Mass spectra were recorded on a Bruker MicroTof QII mass spectrometer and MALDI-TOF. UV-vis studies were performed in CH<sub>3</sub>CN and HEPES buffer (pH = 7.0). Data are reported as follows: chemical shifts in ppm (δ), multiplicity (s = singlet, br = broad, d = doublet, t = triplet, m = multiplet), coupling constants *J* (Hz), integration, and interpretation. Silica gel 60 (60–120 mesh) was used for column chromatography. Fluorescence quantum yield<sup>1</sup> was determined by using optically matching solution of fluorescence (Φ<sub>fr</sub> = fluorescein) as standard at an excitation wavelength of 490 nm and quantum yield is calculated using the equation:

$$\Phi_{fs} = \Phi_{fr} \times \frac{1-10^{-A_r L_r}}{1-10^{-A_s L_s}} \times \frac{N_s^2}{N_r^2} \times \frac{D_s}{D_r}$$

Φ<sub>fs</sub> and Φ<sub>fr</sub> are the radiative quantum yields of sample and the reference respectively, A<sub>s</sub> and A<sub>r</sub> are the absorbance of the sample and the reference respectively, D<sub>s</sub> and D<sub>r</sub> the respective areas of emission for sample and reference. L<sub>s</sub> and L<sub>r</sub> are the lengths of the absorption cells of sample and reference respectively. N<sub>s</sub> and N<sub>r</sub> are the refractive indices of the sample and reference solutions.

**Figure 8.** Fluorescence response of **3** (5.0  $\mu\text{M}$ ) to various anions (25 equiv) in  $\text{CH}_3\text{CN}/\text{H}_2\text{O}$  (8:2, v/v);  $\lambda_{\text{ex}} = 490$  nm. Bars represent the emission intensity ratio ( $I/I_0$ ) ( $I_0$  = initial fluorescence intensity at 528 nm;  $I$  = final fluorescence intensity at 528 nm after the addition of anions). Blue bars represent selectivity ( $I/I_0$ ) of **3** upon addition of different anions; red bars represent competitive selectivity of probe **3** towards  $\text{CN}^-$  ions (25 equiv) in the presence of other anions (25 equiv).

## Calculations for detection limit:

**Figure 9.** Figure showing the fluorescence intensity at 528 nm as a function of CN<sup>-</sup> ions concentration (M).

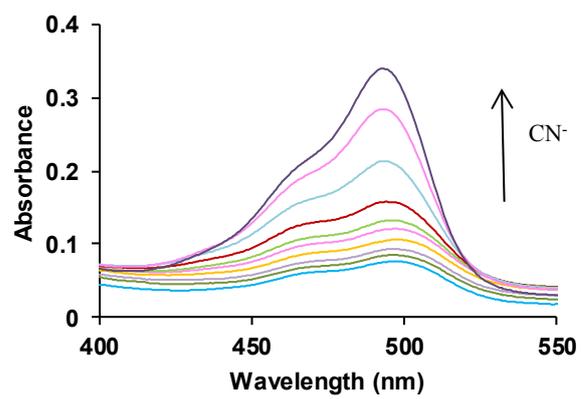

The detection limit was calculated based on the fluorescence titration. To determine the S/N ratio, the emission intensity of receptor **3** without CN<sup>-</sup> was measured by 10 times and the standard deviation of blank measurements was determined. The detection limit is then calculated with the following equation:

$$DL = 3 \times SD/S$$

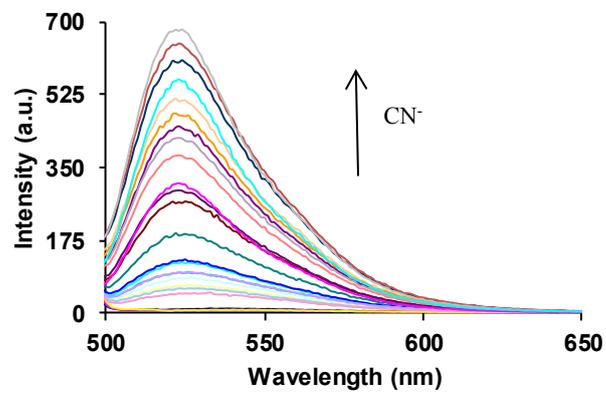

Where SD is the standard deviation of the blank solution measured by 10 times; S is the slope of the calibration curve.

From the graph we get slope (S) = 409999.9, and SD value is 0.02612

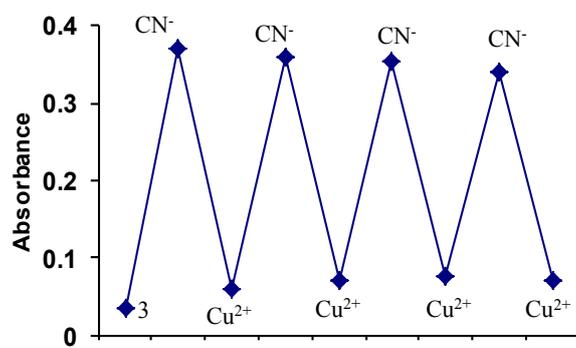

Thus using the formula we get the Detection Limit (DL) =  $1.911 \times 10^{-7}$  M i.e. probe **3** can detect CN<sup>-</sup> in this minimum concentration through fluorescence method.

**Figure 10.** Absorption spectra of 3-CN-Cu<sup>2+</sup> upon the addition of CN<sup>-</sup> ions (0-30 equiv) in CH<sub>3</sub>CN/H<sub>2</sub>O (8:2, v/v) buffered with HEPES, pH = 7.0.

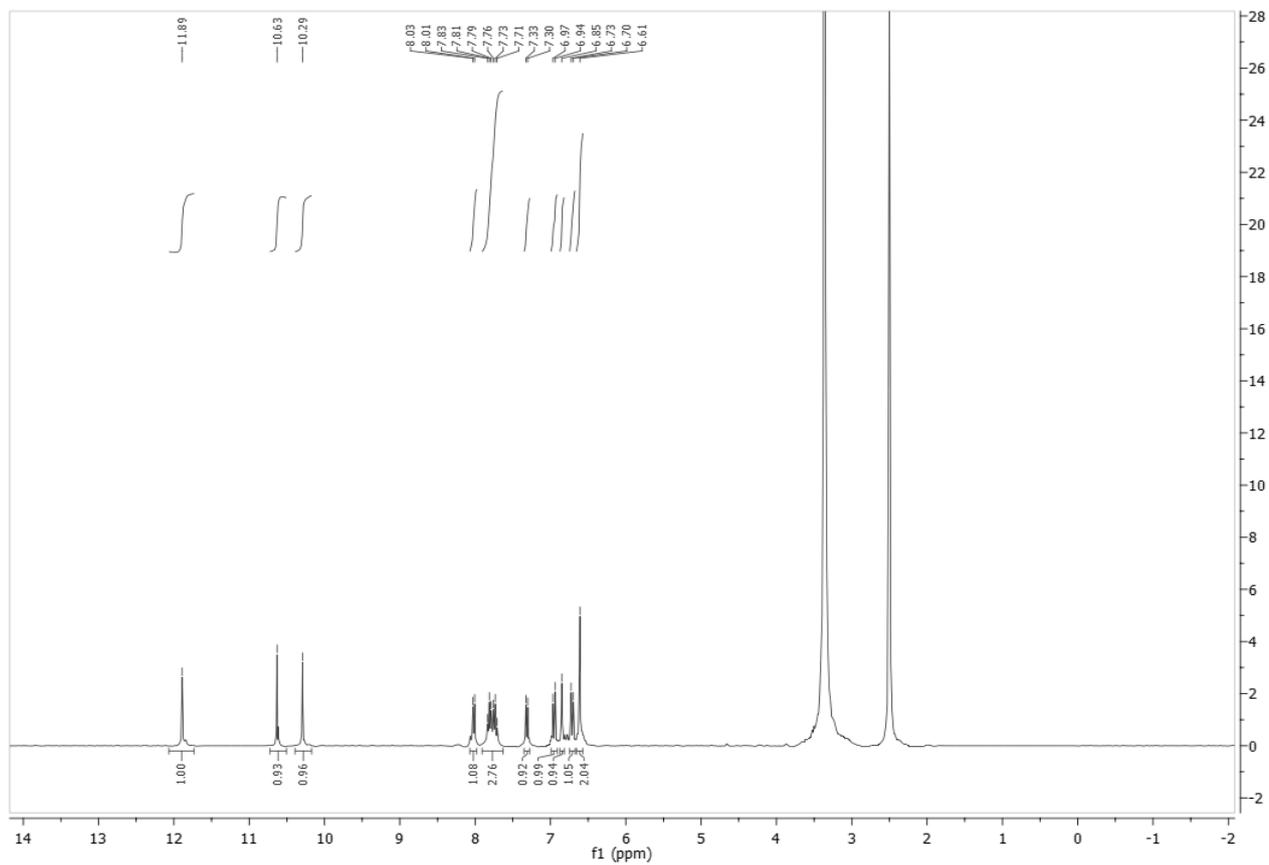

**Figure 11.** Fluorescence spectra of  $3\text{-CN}^-\text{-Cu}^{2+}$  upon the addition of  $\text{CN}^-$  anions (0-30 equiv) in  $\text{CH}_3\text{CN}/\text{H}_2\text{O}$  (8:2, v/v) buffered with HEPES,  $\text{pH} = 7.0$ ;  $\lambda_{\text{ex}} = 490$  nm.

**Figure 12.** Reversibility changes in absorbance spectrum of compound **3** upon the sequential addition of CN<sup>-</sup> and Cu<sup>2+</sup> ions.

**$^1\text{H}$  NMR (DMSO- $d_6$ , 400 MHz, ppm) of compound 2:**
