

Supplementary Information

SI 1. PEI density of grafting

Theoretical calculation for 1:1 (w:w) ratio (w = 2mg):

Tube specific surface: 121 m²/g (measured by BET)

m PEI = m tube = 2 mg correspond to 2.42E+17 nm² (=121 m²/g * 2 mg)

M PEI = 1,800 g/Mol

n PEI = 0.002/1,800 = 1.1111E-06 Mol

Number of PEI units = n PEI * N_{Avogadro} = 1.1111E-06*6.02E+23 = 6.69E+17 PEI

Theoretical grafting density (PEI/nm²) = 6.69E+17/2.42E+17 = 2.76 PEI/nm²

Experimental density of grafting:

TiONts:PEI (w:w)	Theoretical grafting density (PEI/nm ²)	Experimental binding efficiency (%)	Experimental grafting density (PEI/nm ²)
1:0.01	0.03	60.9	0.02
1:0.05	0.14	75.5	0.10
1:0.1	0.28	58.3	0.16
1:0.3	0.83	21.0	0.17
1:0.5	1.38	18.9	0.26
1:1	2.76	15.2	0.42
1:10	27.65	<u>nd</u>	<u>nd</u>

nd: not determined

SI 2. PEG density of grafting

Theoretical calculation for TiONts-PEG₂₀₀₀:

The TiONts:PEG ratio used for the functionalization was 1:30 (w:w).

Tube specific surface: 121 m²/g (measured by BET)

m tube = 1 mg correspond to 1.21E+17 nm²

M PEG = 2000 g/Mol

n PEG = 0.03/2000 = 1.5E-05 Mol

Number of PEG units = n PEG * N_{Avogadro} = 1.5E-05*6.02E+23 = 9.03E+18 PEG

Theoretical grafting density (PEG/nm²) = 9.03E+18/1.21E+17 = 7.47E+01 PEG/nm²

Experimental density of grafting for TiONts-PEG₂₀₀₀:

The mass percentage, due to PEG decomposition, between 125°C and 650°C was 17.2%.

$$\begin{aligned} N_{PEG} &= \frac{(\Delta m_{exp}) \cdot N_A}{M_{PEG} \cdot S_{BET} \cdot 10^{18}} \\ \text{Number of PEG units} &= \\ &= 17.2 \cdot 6.02E+23 / (2000 \cdot 121 E+18) = 0.43 \text{ PEG/nm}^2 \end{aligned}$$

SI 3. SEM images of (a-b) bare titanate nanotubes, (c-d) TiONts/Si-mPEG₂₀₀₀ nanohybrids, (e-f) TiONts/PEI₁₈₀₀ (1:1, w:w) nanohybrids.
