## 3. Crystallographic details

X-ray diffraction data were collected on an Agilent SuperNova diffractometer fitted with an Atlas CCD detector with Mo-K $\alpha$ radiation $(\lambda=0.71073 \AA$ ) or $\mathrm{Cu} \mathrm{K} \alpha$ radiation $(\lambda=$ $1.5418 \AA$ ). Crystals were mounted under oil on glass or nylon fibres. Data sets were corrected for absorption using a multiscan method, and the structures were solved by direct methods using SHELXS-97 and refined by full-matrix least squares on F2 using ShelXL-97, interfaced through the program X-Seed. Molecular graphics for all structures were generated using POV-RAY in the X-Seed program.

## Crystallographic details for 2b

## 4. Chemosensitivity data

Cells were incubated in 96-well plates, at $2 \times 103$ cells per well in $200 \mu \mathrm{~L}$ of growth media (RPMI 1640 supplemented with $10 \%$ foetal calf serum, sodium pyruvate ( 1 mM ) and L-glutamine ( 2 mM )). Cells were incubated for 24 hours at $37^{\circ} \mathrm{C}$ in an atmosphere of $5 \% \mathrm{CO}_{2}$ prior to drug exposure. Silver compounds and cisplatin were dissolved in dimethylsulfoxide at a concentration of 25 mM and diluted with medium to obtain drug solutions ranging from $25 \mu \mathrm{M}$ to $0.049 \mu \mathrm{M}$. The final dimethylsulfoxide concentration
was $0.1 \% ~(\mathrm{v} / \mathrm{v})$ which is non-toxic to cells. Drug solutions were applied to cells and incubated for 96 hours at $37{ }^{\circ} \mathrm{C}$ in an atmosphere of $5 \mathrm{CO}_{2}$. The solutions were removed from the wells and fresh medium added to each well along with $20 \mu \mathrm{~L}$ MTT $(5 \mathrm{mg} / \mathrm{mL})$, and incubated for 4 hours at $37^{\circ} \mathrm{C}$ in an atmosphere of $5 \% \mathrm{CO}_{2}$. The solutions were removed and $150 \mu \mathrm{~L}$ dimethylsulfoxide was added to each well to dissolve the purple formazan crystals. A plate reader was used to measure the absorbance at 540 nm . Lanes containing medium only, and cells in medium only (no drug), were used as blanks for the spectrophotometer and $100 \%$ cell survival respectively. Cell survival was determined as the absorbance of treated cells divided by the absorbance of controls and expressed as a percentage. The concentration required to kill $50 \%$ of cells $\left(\mathrm{IC}_{50}\right)$ was determined from plots of \% survival against drug concentration. Each experiment was repeated 3 times and a mean value obtained.

Table S1 Response of eight cell lines to silver(I)-NHC complexes 3a-3e and cisplatin. Values presented are $\mathrm{IC}_{50} \mu \mathrm{M} \pm \mathrm{SD}$ (in parentheses) for three independent experiments.

## 5. $\quad \log P$ data

Equal volumes of octanol and NaCl -saturated water were stirred at room temperature for 24 hours, and separated to give octanol-saturated water and water-saturated octanol. Five standard concentrations ( $5,10,20,40$ and $60 \mu \mathrm{M}$ ) of the complexes were prepared from the octanol-saturated water. Analysis using UV / vis spectroscopy was used to obtain a calibration curve of absorbance vs. concentration for each complex at its maximum absorbance. Accurate amounts of the complexes were dissolved in the octanol-saturated water ( 25 mL ) to make up a concentration of $50 \mu \mathrm{M} .3 \mathrm{~mL}$ of octanol-saturated water containing the complex was placed in a centrifuge tube and 3 mL of water-saturated octanol was layered on top. Six samples prepared in this manner were shaken for 4 hours using a vibrax machine at $500 \mathrm{gmin}^{-1}$. The layers were separated and the octanol-saturated water layer was retained for analysis using UV / vis spectroscopy. The average concentration of the six runs was calculated using the calibration graph and maximum absorbance for each complex. Subtraction of the average concentration obtained from the concentration of an unshaken sample in octanol-saturated water gave the final $[C]_{\text {org. }}$. The $[C]_{\text {org }}$ and $[C]_{a q}$ were used to determine the partition coefficient $\log P$.

Fig. S9 Bar chart to show $\log P$ values for complexes 3a-3e.
