^a significant correlations (correlation values >0.2 or <-0.2 for rank correlation, p-values <0.05 for Kurskal-Wallis test) are marked bold, significant positive correlations in italic.

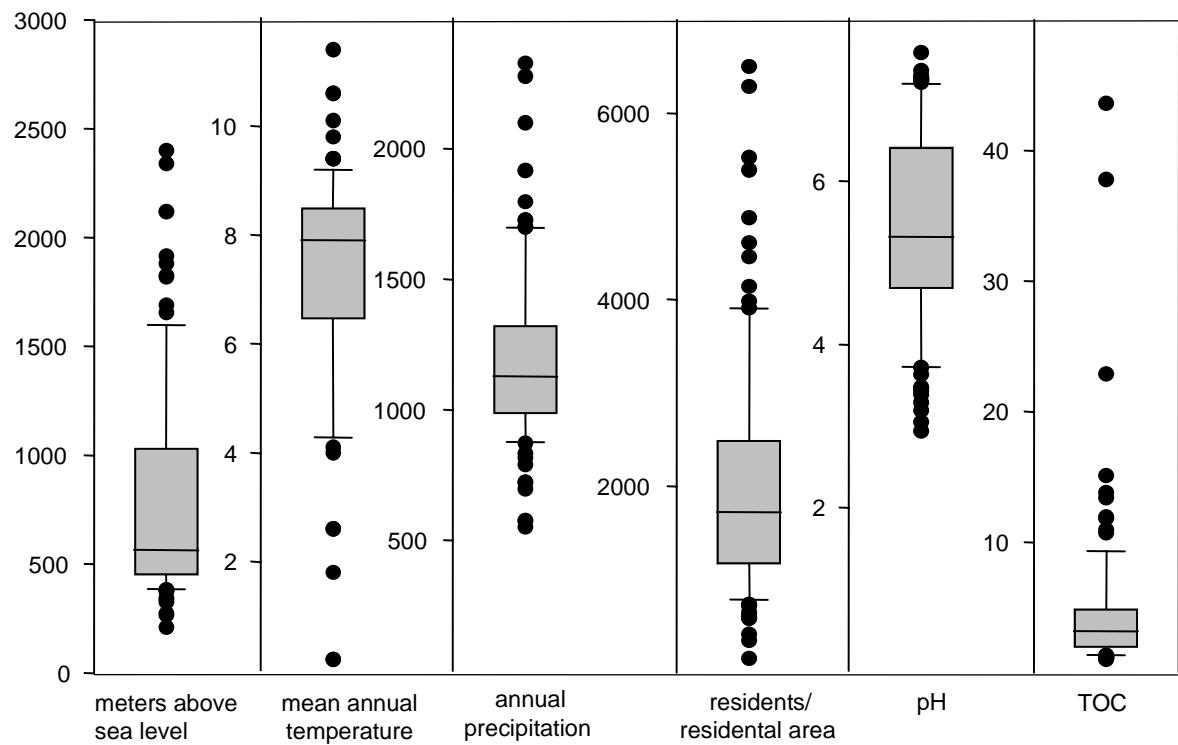

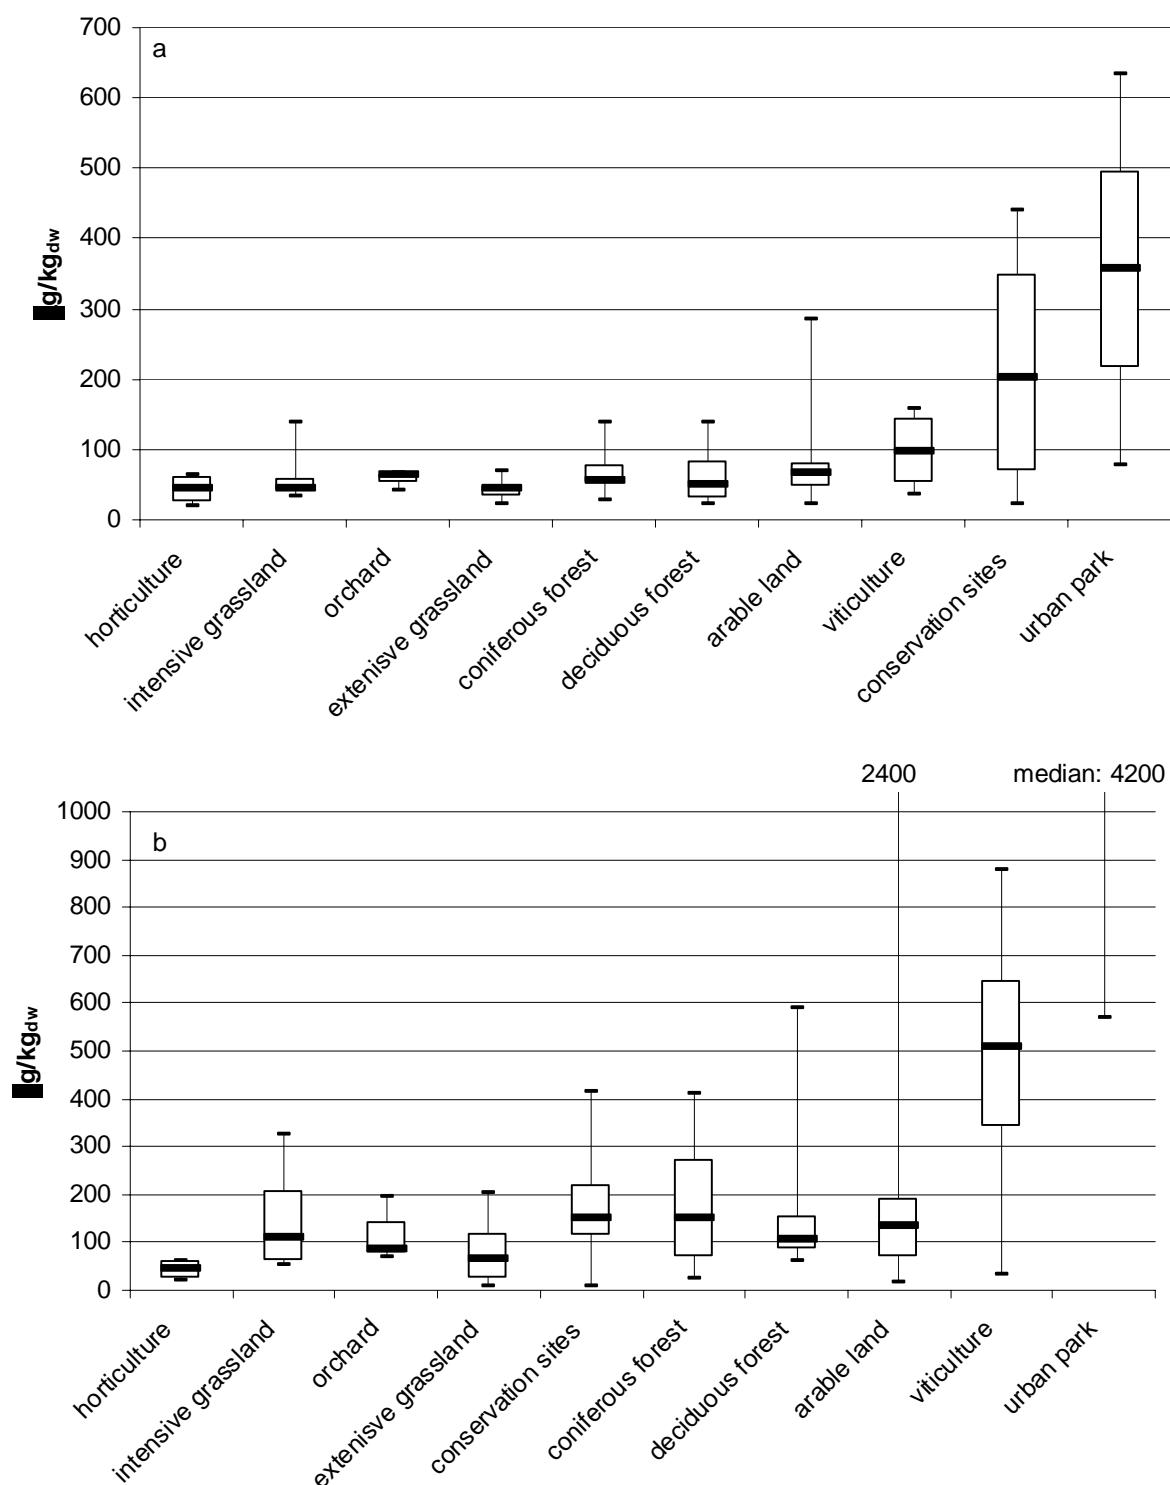

Figure 1: Describing parameters of the sampling sites, units: elevation: meters, temperature: °C, precipitation: millimetres, residents/residential area: persons/km², TOC: total organic carbon content: % dry weight

a) sum of the light PAH (NAP-PHE) for different land uses, b) sum of the heavy PAH (ANT-BPE) for different land uses (in increasing order according to the multi regression model), values outside the scale are indicated with numbers.

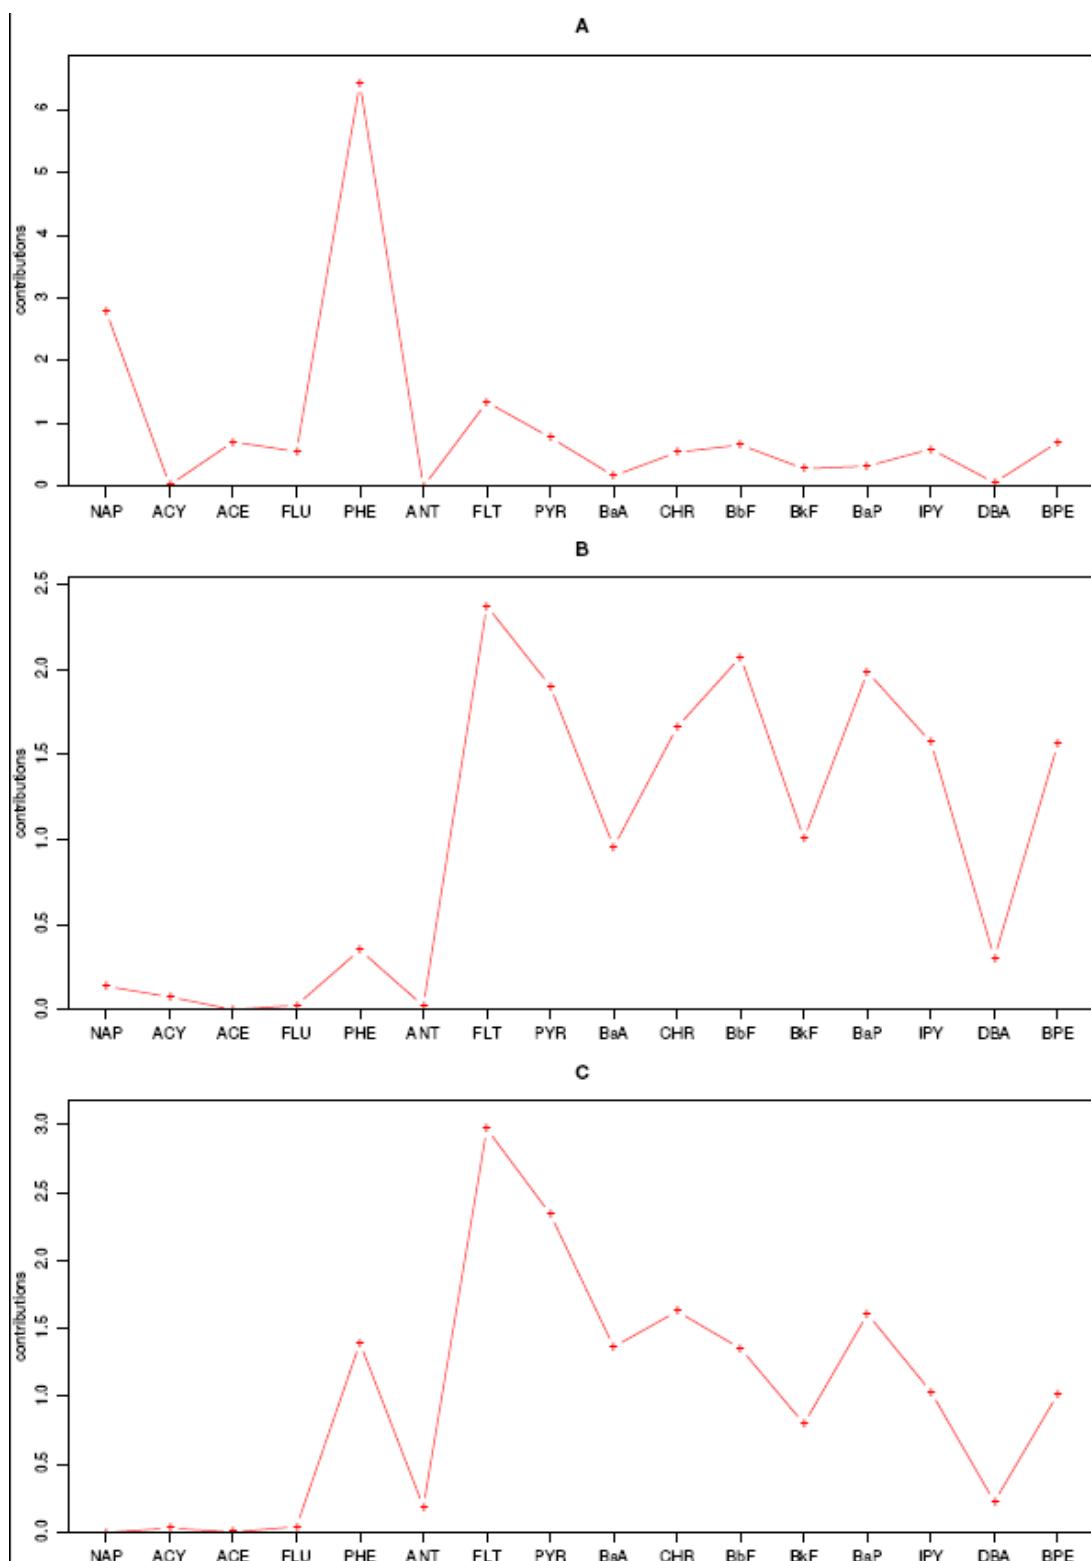

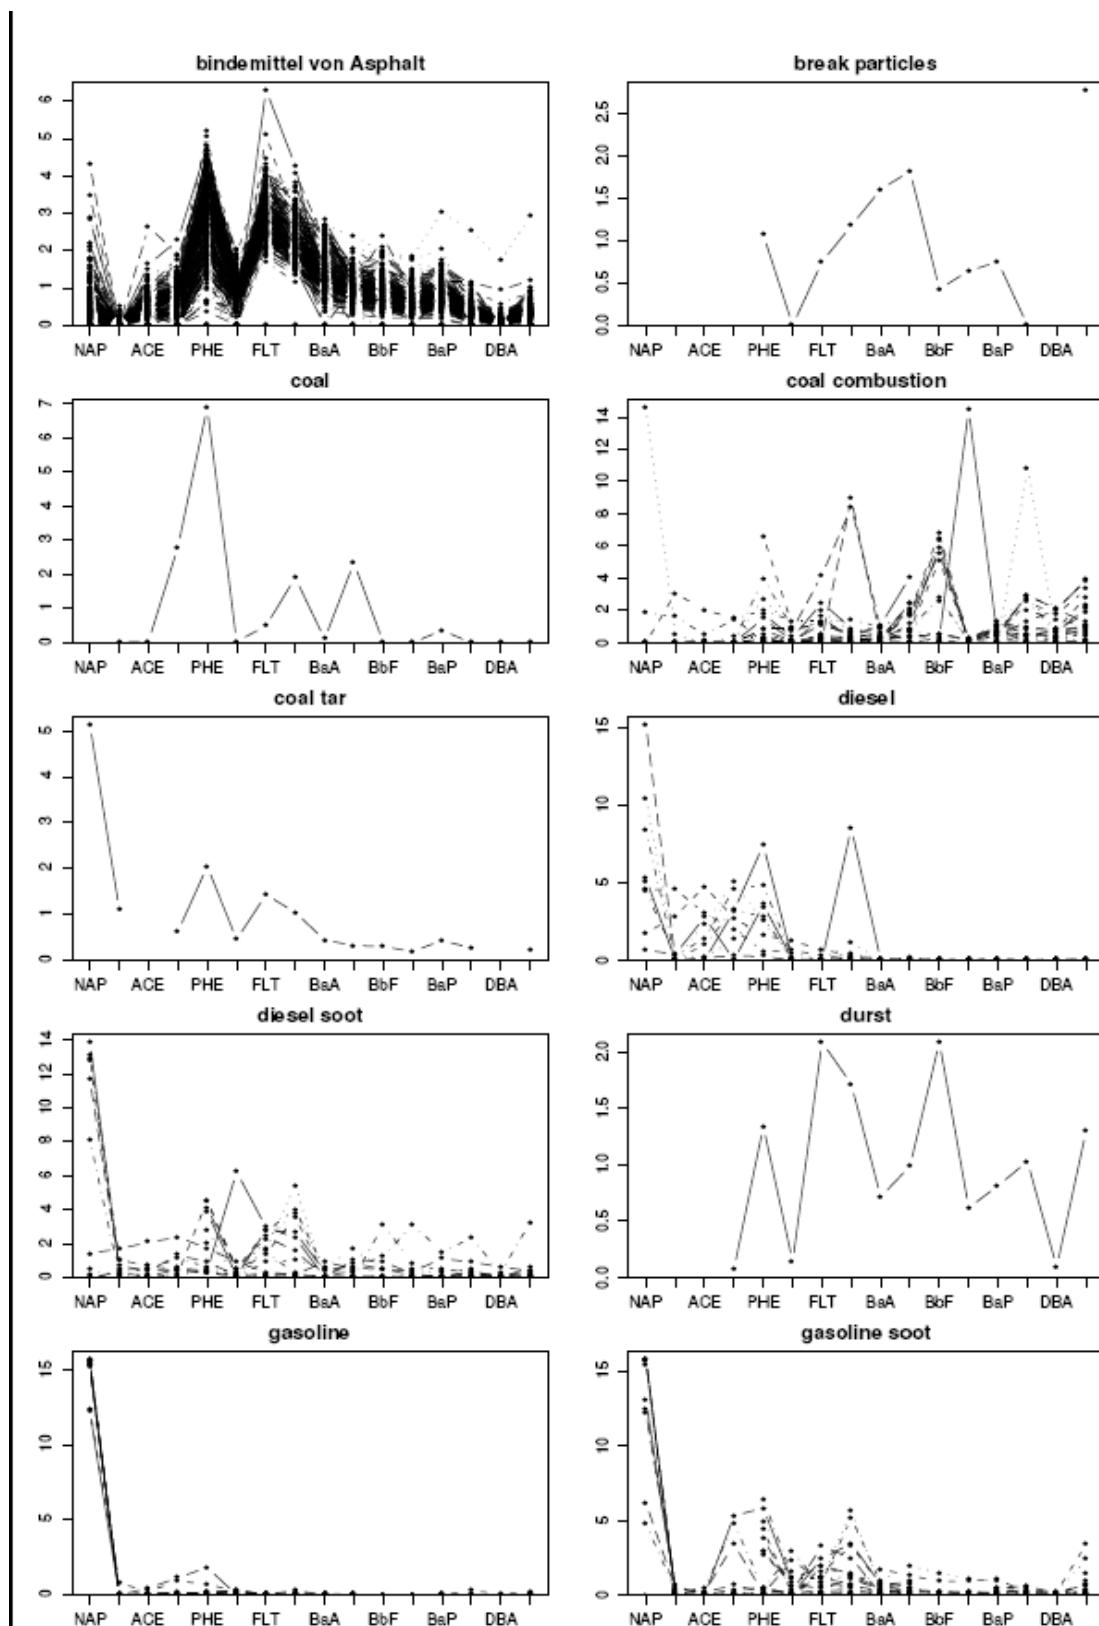

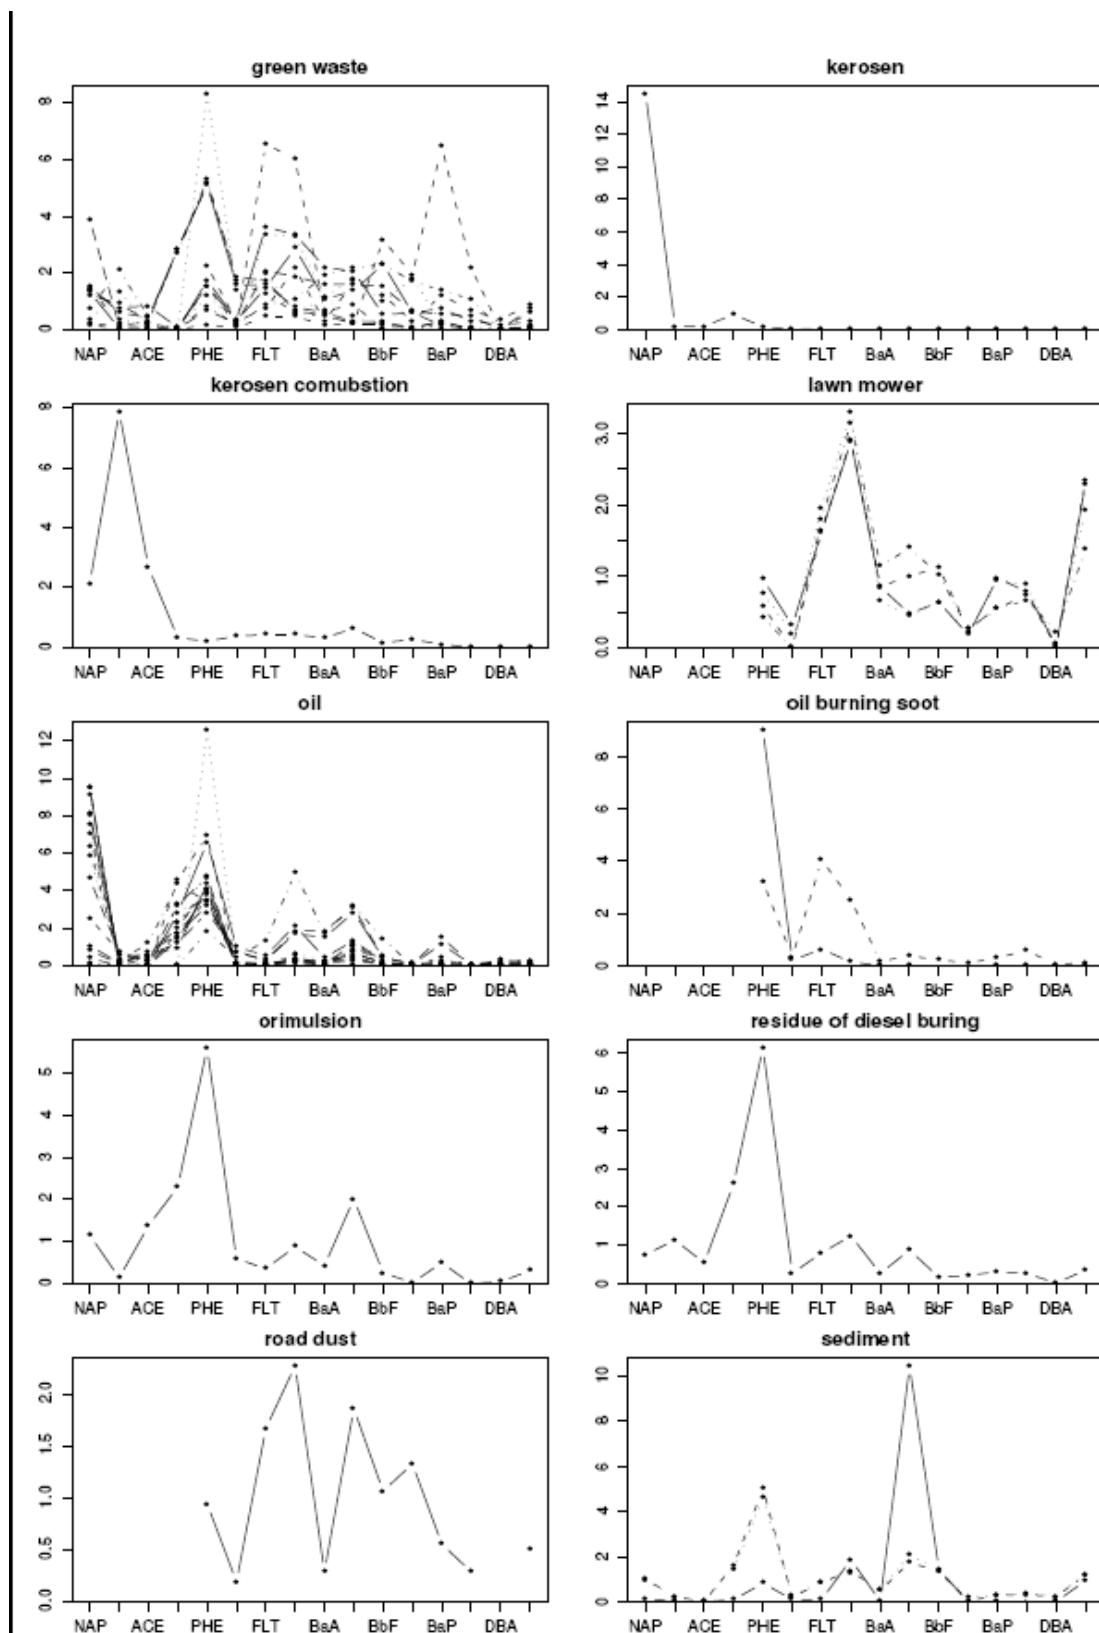

Figure 3: Characteristic profiles identified by the linear mixing model in original units A) light profile, B) heavy profile with emphasis on the most heavy compounds, C) heavy profile with emphasis on the lower end of the heavy compounds.

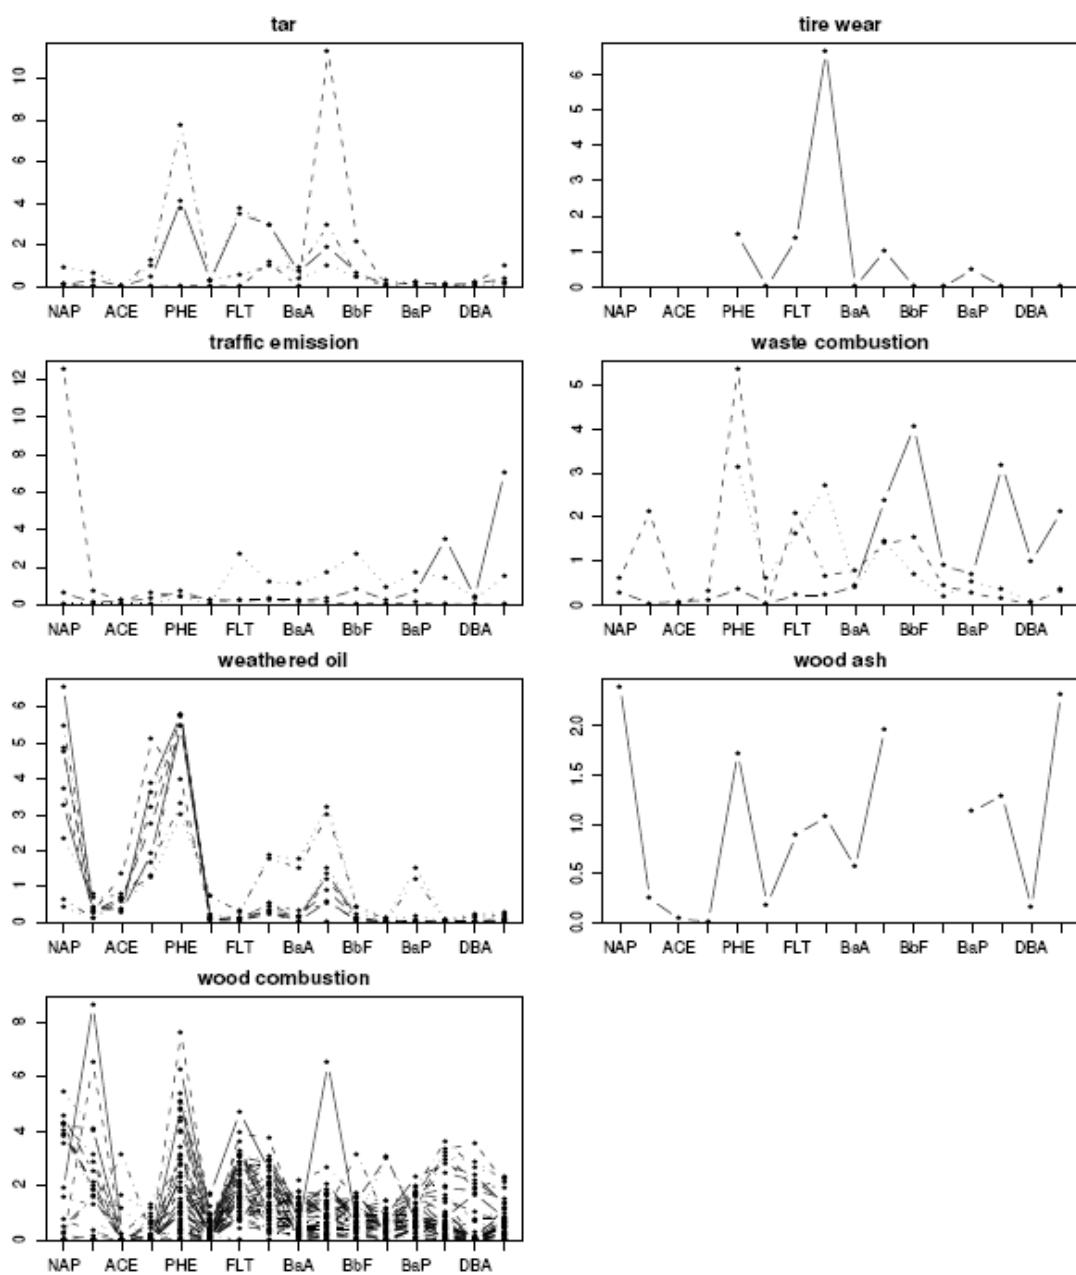

Figure 4: Emission profiles collected from the literature ¹
