INTRODUCTION

The first section ‘General information on conditions during the observation period’ contains
information such as the dates of the study period, the general meteorological conditions and
information on changes in the general outdoor air quality during the study period.

The technical specifications of the interventions are provided in Tables S1 and S2. The
outdoor temperature, humidity and measured air quality parameters are presented in Table S3.

The indoor temperature, humidity and measured air quality parameters over the entire study
period are provided in Table S4 for classroom A and in Table S5 for classroom B. The
changes of the IAQ parameters from the baseline to the intervention setting are presented in
Table S6. An overview of the I/O ratios for all studied conditions is presented in Table S7.
Figure S1 show some photos of the school building and Figure S2 shows the interior of the
classroom at the time the interventions were installed. The outdoor concentrations of PM-10
and PM-2.5 at the school and the PM-10 concentration at a nearby air monitoring station over
the entire study period are presented in Figure S3.

GENERAL INFORMATION ON CONDITIONS DURING THE OBSERVATION

PERIOD

The measurements started on Monday November 1st 2011 and were finalized on Friday December 2nd 2011. The outdoor temperature (Table S3) was exceptionally high for November in the Netherlands with an average air temperature ranging from 9.6 to 19.4°C. It was the third sunniest month since 1908 with 95 sun hours compared to an average of 63 and there was only 9 ml of precipitation compared to 82 on average since 1906. The average relative humidity ranged from 55.5 to 68.0%. The wind direction was atypical showing more South to East wind direction than usual, resulting in more stable or stagnant atmospheric conditions than usual and on some days fog occurred (KNMI, 2012). The indoor air temperature was approximately 18°C during the weekend and around 22°C during teaching hours and comparable in the two classrooms (see Table S4 for classroom A and Table S5 for classroom B). Only during the first weekend the average temperature in classroom A was somewhat higher than in classroom B (19.3°C vs. 18.3°C). The average relative humidity varied between 35 and 60% and was similar in both classrooms (Tables S4 and S5). During the weekend the concentration of CO₂ was 400-500 ppm, corresponding to outdoor values. During the lessons the CO₂ concentrations reached hour-average values of 1,500 to 2,100 ppm in both classrooms. The general outdoor air quality was rather poor, due to the stagnant atmospheric conditions. This resulted in a time-weighted average of PM-10 of 42 µg/m³ and a PM-2.5 value 34 µg/m³ over the entire study period, based on local measurements at the school location. For PM-2.5 and PM-10 the outdoor concentrations went up to levels above 100 µg/m³ during episodes of high PM air pollution on November 7-8 and a high peak of PM-10 on November 23 (Figure S3). The pattern of PM-10 at the study location agreed well with the general background PM-10 levels over the study period measured at other air monitoring locations in The Netherlands.

1 Table S1: Technical data and product claims for the dust reducing carpet.

Manufacturer	Desso, Waalwijk, The Netherlands
Type	AirMaster®
Description	Carpet tiles
Dimensions	50 x 50 cm
Technical description	The carpet consists of thin yarns capturing and retaining the fine dust (DESSO Airfilters™) and thicker yarns capturing and retaining the coarser fine dust (DESSO DustCollectors™) For more technical information see: http://www.desso-airmaster.com/
Maintenance	Vacuum cleaning in the direction of the pile, at least twice a week, using a vacuum cleaner with a HEPA filter
Results of laboratory testing	The concentration of PM-10 was fourfold lower compared to a standard structured loop pile carpet and eightfold lower compared to a hard polyvinyl floor ^a

2 ^a The authors were given access to the original reports.

3

1 Table S2: Technical data and product claims for the air filtration unit.

Manufacturer	Philips, Drachten, The Netherlands
Type	AC4091
Technology used	Filtration and adsorption
Filter type	Pre-filter and formaldehyde filter (type AC4187)
Effective area	up to 70 m ²
Air filtration capacity	Setting 1: (AUTO) Setting 2: (SILENT): 150 m ³ /h Setting 3: 180 m ³ /h Setting 4: 270 m ³ /h Setting 5 (TURBO): 390 m ³ /h
Clean air delivery rate (CADR)*	340 m ³ /h
Ozon emission	Negligible
Noise level	37 (SILENT) – 58 dB (TURBO).
Wattage	51 W
Dimensions (W x D x H)	45.5 x 29.5 x 68.5 cm
Weight	12 kg
Maintenance	If the pre-filter is soiled (indicated by the flashing sensor) the filter can be removed and cleaned using tap water followed by air drying. For the use in homes it is recommended to clean the pre-filter once every two weeks
Change of filters	Once every three years for the use in homes
Reduction particulate matter	98.1 % dust/pollen (0.3 µm) ^a
Reduction of VOC	98.1 % for total VOC ^a 97.5 % for benzene ^a
Reduction of formaldehyde	99.1 % for formaldehyde when using filter AC4187 ^a
Reduction of microorganisms	>99.9 % of for bacteria (<i>Staphylococcus alba</i>)

2 ^a These results were obtained at the Guandong Detection Centre of Microbiology.
