Supplementary Information: Green Chemistry Metrics – Table 3

The Original Synthesis:

*Anastas, Weber, and Stevenson's approach to arynaphthalene lactones:
3 total steps calculated*

E-factor

Steps 1 & 2:

<u>Input</u>	<u>Mass(kg)</u>
3,4-Dimethoxyphenyl propionic acid (SM 1)	1.71
Thionyl chloride (TC)	16.57
3,4-Dimethoxyphenyl propargyl alcohol (SM 2)	1.53
P4-VP ploymer (resin)	3.80
Dichloromethane (DCM)	100.69

Output

3,4-dimethoxyphenylpropargyl 3,4-dimethoxyphenylpropiolate (DP)	2.2
---	-----

Waste

$W_{1,2} = ((1.71 \text{ kg SM 1}) + (1.53 \text{ kg SM2}) - 2.2 \text{ kg DP}) + 16.57 \text{ kg TC} + 3.80 \text{ kg resin} + 100.69 \text{ kg DCM} = 122.1 \text{ kg waste from steps 1 \& 2}$

Step 3:

<u>Input</u>	<u>Mass (kg)</u>
3,4-dimethoxyphenylpropargyl 3,4-dimethoxyphenylpropionate (SM 3)	2.20

Xylenes 15.80

Output

Desired Product 1.0

Waste

$W_3 = (2.2 \text{ kg SM 3} - 1 \text{ kg Desired Product}) + 15.8 \text{ kg xylenes} = 17 \text{ kg waste from step 3}$

Calculated E-factor:

$E\text{-factor} = (122.1 \text{ kg } W_{1,2} + 17 \text{ kg } W_3) / 1 \text{ kg desired product} = 139.1$

Atom Economy

$AE (\%) = (\text{MW Product} / \Sigma \text{MW of Reagents}) \times 100$

<u>Reagent</u>	<u>MW</u>
3,4-Dimethoxyphenyl propionic acid	206.06
3,4-Dimethoxyphenyl propargyl alcohol	192.08
Thionyl Chloride	118.97

Product

Dehydrodimethyl-
conidendrin 380.13

$AE (\%) = (380.13 / (206.06 + 192.08 + 118.97)) \times 100 = 73.5 \%$

The Improved Synthesis:
Reported in this publication
2 steps total

E-factor

Step 1:

<u>Input</u>	<u>Mass (kg)</u>
3,4-Dimethoxyphenyl propargyl alcohol (SM 1)	1.09
Thionyl Chloride (TC)	0.73
N,N-Dimethylacetamide (DMA)	16.70
<u>Output</u>	
3,4-Dimthoxyphenyl propargyl chloride (DP 1)	1.00

Waste

$$W_1 = ((1.09 \text{ kg SM 1}) + (0.73 \text{ kg TC}) - 1.0 \text{ kg DP}) + 16.70 \text{ kg DMA} = 17.5 \text{ kg waste from step 1}$$

Step 2:

<u>Input</u>	<u>Mass (kg)</u>
3,4-Dimethoxyphenyl propargyl chloride (SM 2)	1.00
3,4-Dimethoxyphenyl acetylene (SM 3)	0.77
Potassium carbonate (Base)	0.67
18-Crown-6 (PTC)	0.26
Carbon dioxide (CO ₂)	3.14
Silver Iodide (AgI)	0.11

N,N-Dimethylacetamide
(DMA) 12.53

Output

Dehydrodimethyl-
conidendrin (DP 2) 1.0

Waste

$W_2 = ((1.0 \text{ kg SM } 2) + (0.77 \text{ kg SM } 2) - (1.00 \text{ kg DP } 2)) + 0.67 \text{ kg Base} + 0.26 \text{ kg PTC} + 3.14 \text{ kg CO}_2 + 0.11 \text{ kg AgI} + 12.53 \text{ kg DMA} = 17.48 \text{ kg waste from step 2}$

Calculated E-factor

E-factor = $(17.50 \text{ kg } W_1 + 17.48 \text{ kg } W_2) / 1 \text{ kg Desired Product} = 34.98$

Atom Economy

$AE (\%) = (\text{MW Product} / \Sigma \text{MW of Reagents}) \times 100$

<u>Reagent</u>	<u>MW</u>
3,4-Dimethoxyphenyl acetylene	162.07
3,4-Dimethoxyphenyl propargyl alcohol	192.08
Thionyl Chloride	118.97
Carbon dioxide	43.99

Product

Dehydrodimethyl-
conidendrin 380.13

$AE (\%) = (380.13 / (162.07 + 192.08 + 118.97 + 43.99)) \times 100 = 73.5\%$
