Figure A SEC-ICP-MS chromatograms of a CSF sample (black) and the associated CSF permeate (grey) for Mn, Fe, Cu, Zn, Ca and Mg (3-point average smoothing was applied for Mn, Fe, Cu and Zn; for Fe and Zn only the interesting part of the chromatogram until 10 minutes retention time is shown, no peaks were observed later than 10 minutes).

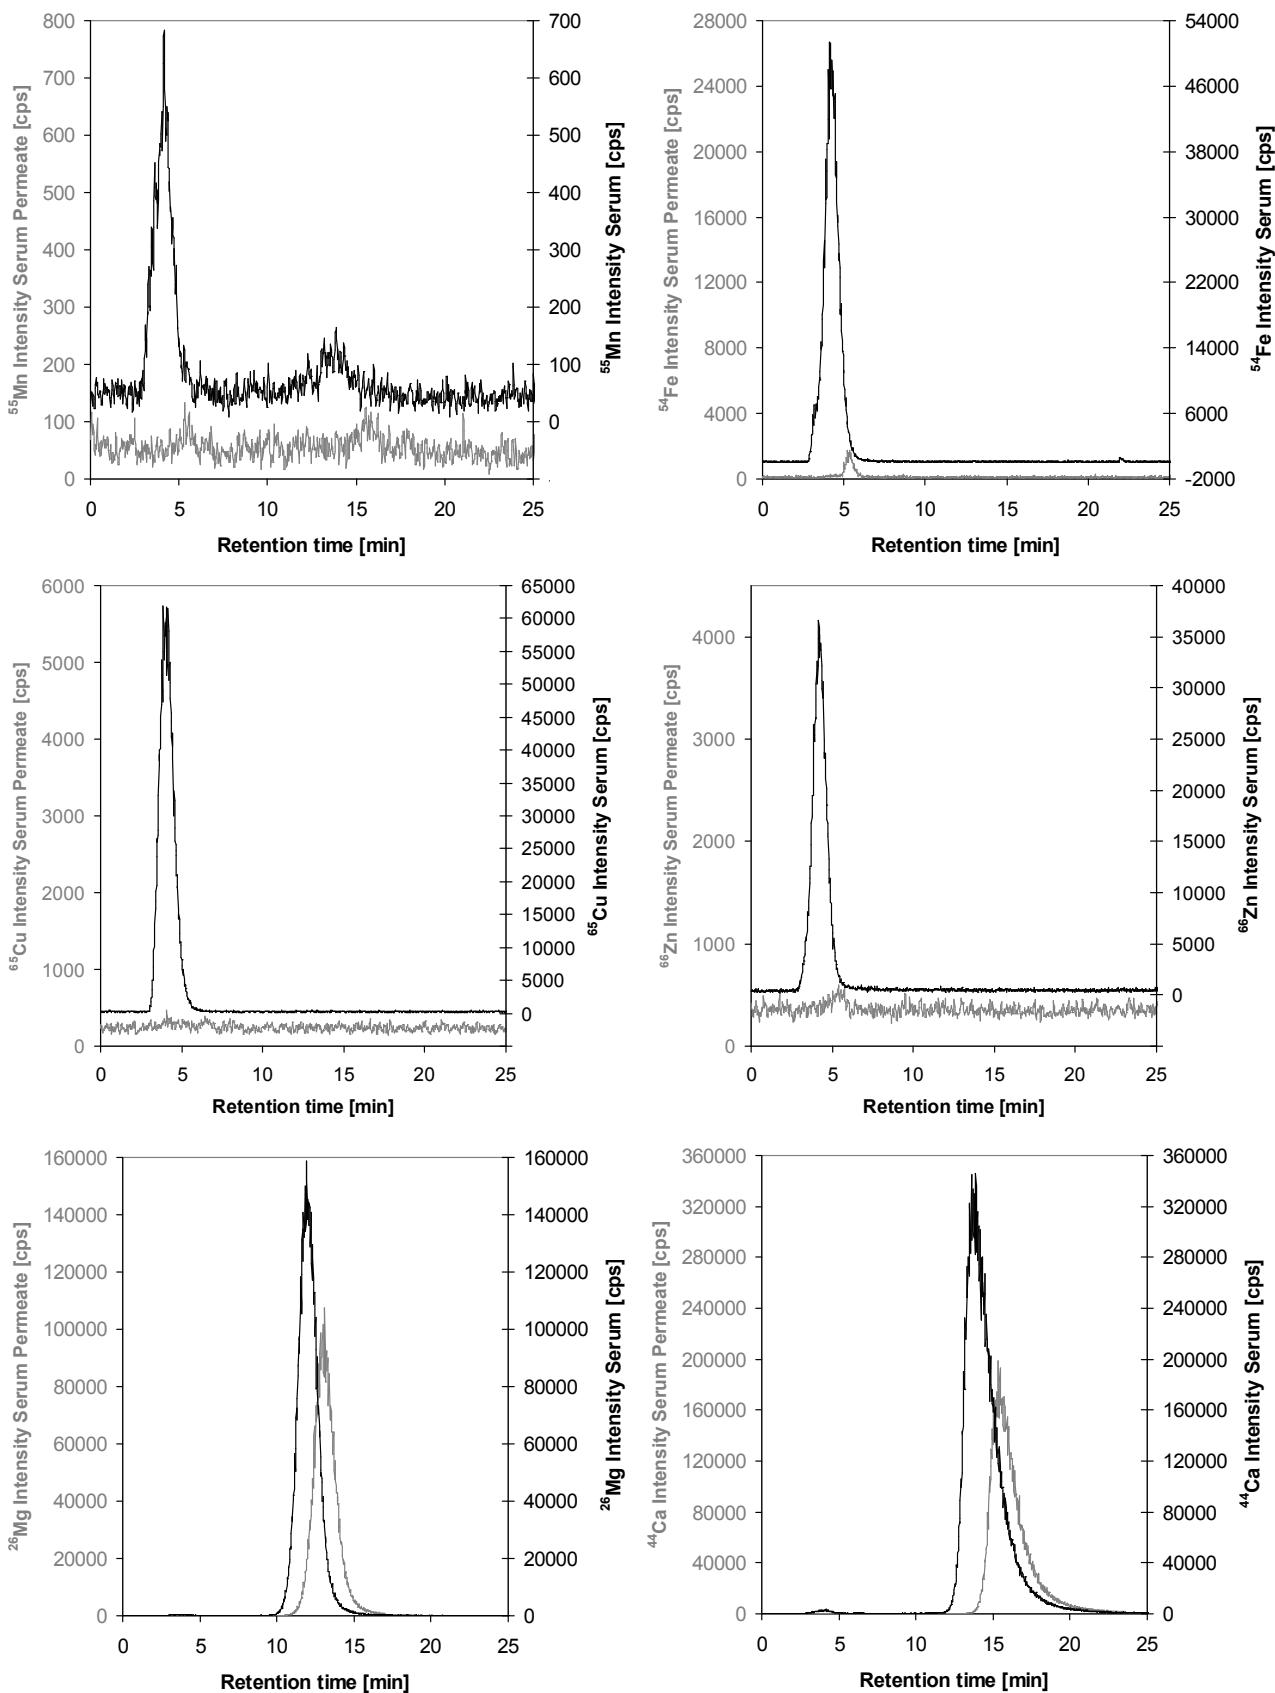

Figure B SEC-ICP-MS chromatograms of a serum sample (black) and the associated serum permeate (grey) (same patient as CSF sample in Figure A) for Mn, Fe, Cu, Zn, Ca and Mg (3-point average smoothing was applied for Mn, for Cu in serum permeate and for Zn in serum permeate).

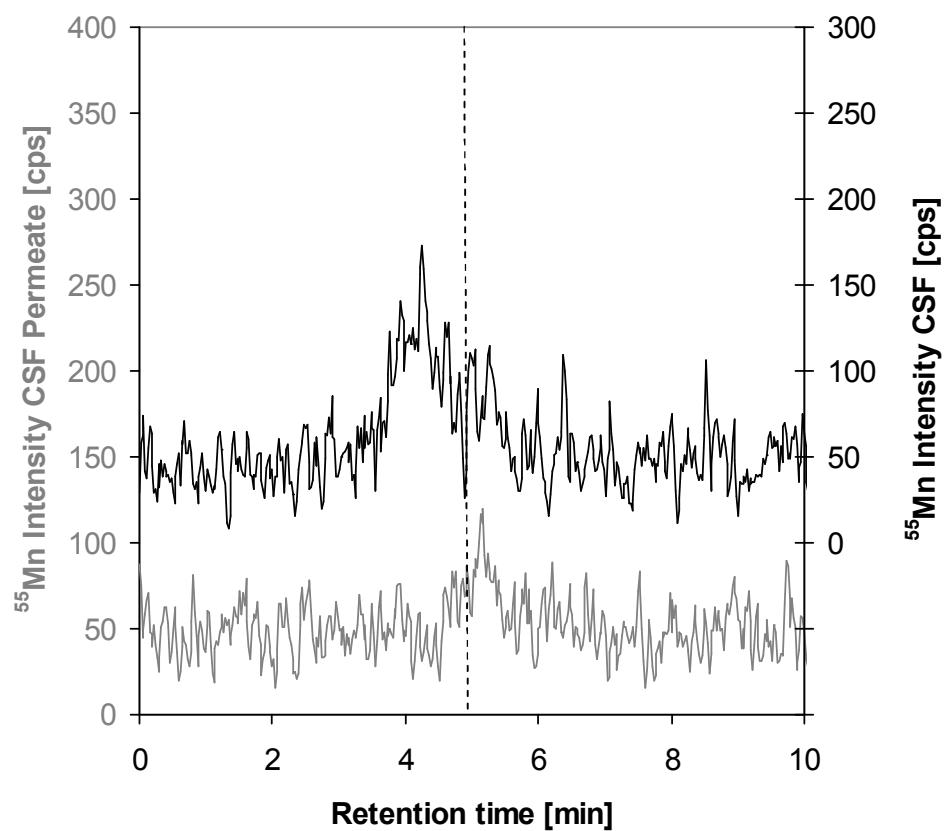

Figure C ^{55}Mn SEC-ICP-MS chromatograms of another CSF sample (black) and the corresponding permeate (grey) obtained from ultrafiltration (3-point average smoothing was applied).

Table A Results for reference sera Seronorm™ (a) and ClinChek® (b) determined using various dilutions (1:8 to 1:40) with ICP-DRC-MS (for Mn, Fe, Cu and Zn both Y and Rh were used as internal standards, for Mg and Ca only Y was used as internal standard). The values in bold print are within the control range (Mn in Seronorm™ as well as Fe and Ca in ClinChek® are not certified).
