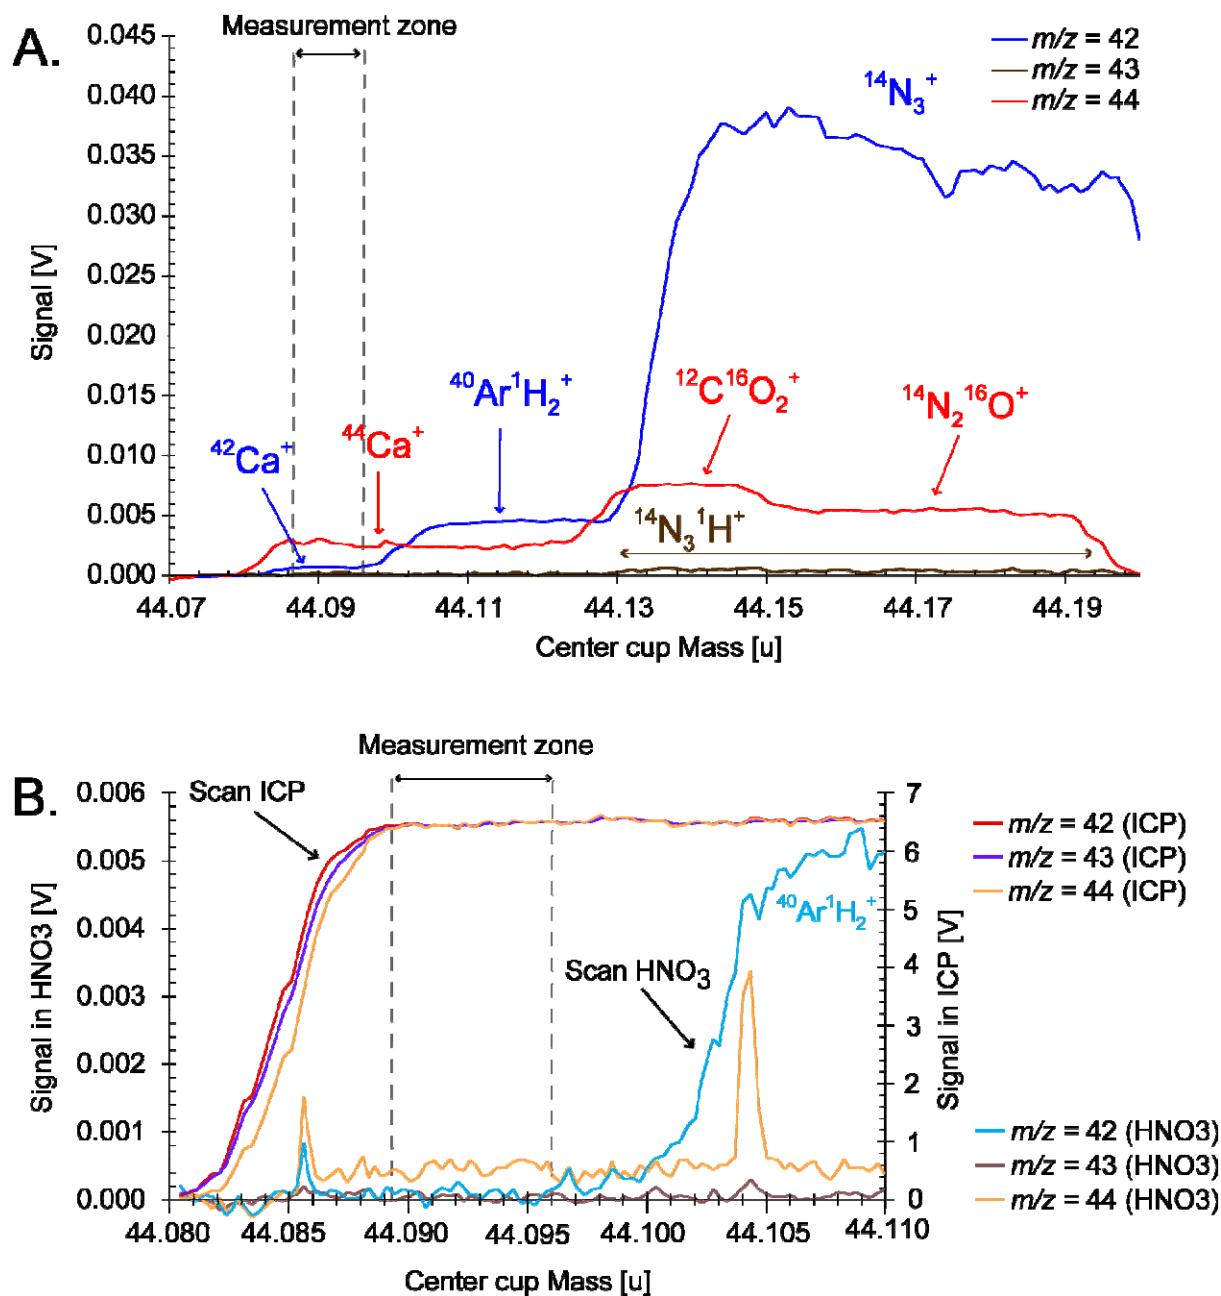

Figure S1 A and B: **Mass scans centered on central cup with a global view of polyatomic interferences in 0.05 N HNO₃ (A) and a zoom in on measurement zone (B) with signals corresponding to 0.05 N HNO₃ and to ICP Ca standard.** Interfering species are noted next to each interference peak. Calcium isotope measurements were carried out between the left side of Ca peak and $^{40}\text{Ar}^1\text{H}_2^+$ growing interference on the right side of 42 signal, as delimited by the dotted lines.

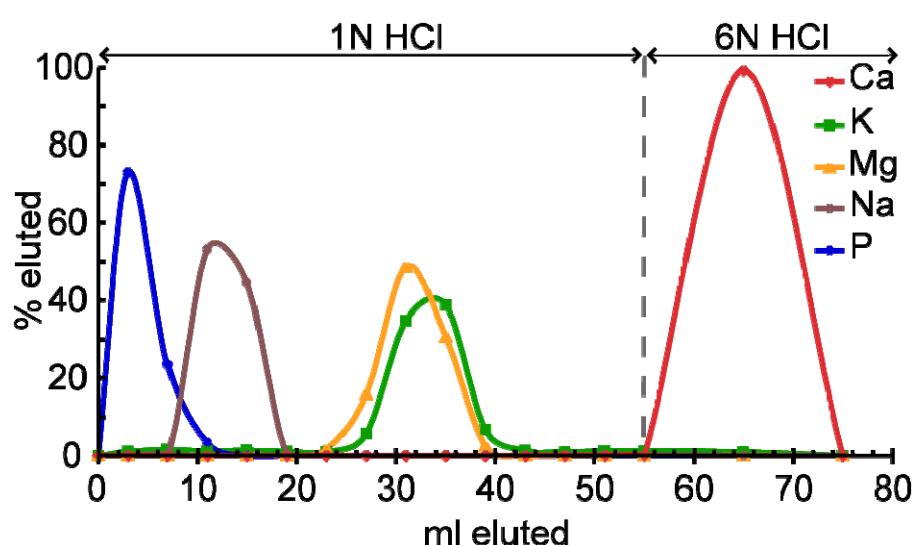

Figure S2: Elution profiles on AG50W-X12 columns for sheep serum. Each curve represents the massic percentage of eluted element as a function of introduced eluent volume.

	Indiv.	Material	<i>n</i>	$\delta^{44/42}\text{Ca}$ ‰ p.amu	$\delta^{43/42}\text{Ca}$ ‰	$\delta^{44/43}\text{Ca}$ ‰	43.5/44	[Ca] ppm

Table S1: Isotopic compositions with respect to ICP Ca standard for all analyzed materials, including standards and sheep samples. For each material, *n* is the number of spectrometric measurements. When *n*=1, 2SD errors correspond to average 2SD errors on standard measurements. 43.5/44 ratio is the ratio of $^{87}\text{Sr}^{2+}$ and ^{44}Ca signals for each measurement. Concentrations were measured in freeze-dried samples, except for urine and seawater, measured in wet samples.¹ Ca concentrations are stoichiometric concentrations of Ca from hydroxyapatite. ² Ca concentrations are certified values from NIST.
