

Supplementary Information:
Self-cleaning anatase nanorods: Photocatalytic removal of structure
directing agents and subsequent surface modification

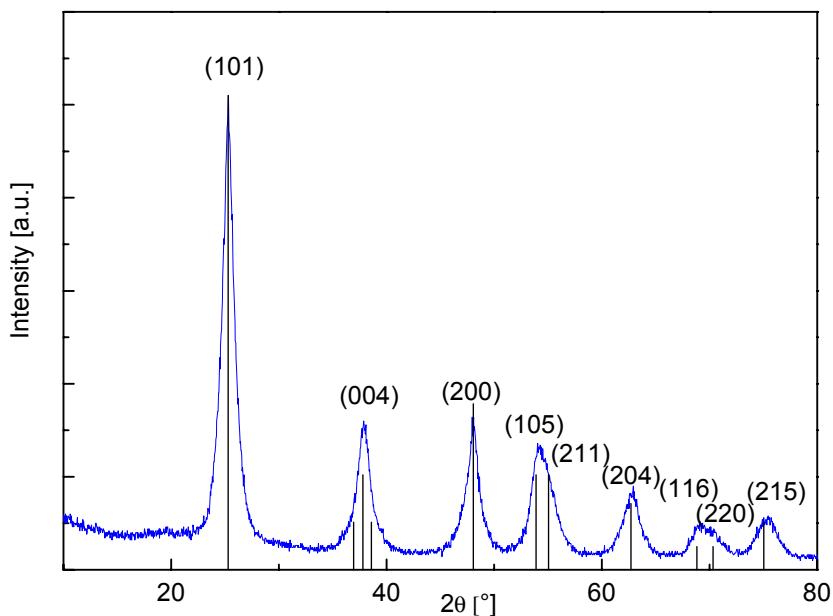

Fig. S1 – Powder XRD pattern of the as-prepared TiO_2 nanorods, with standard diffraction lines of anatase

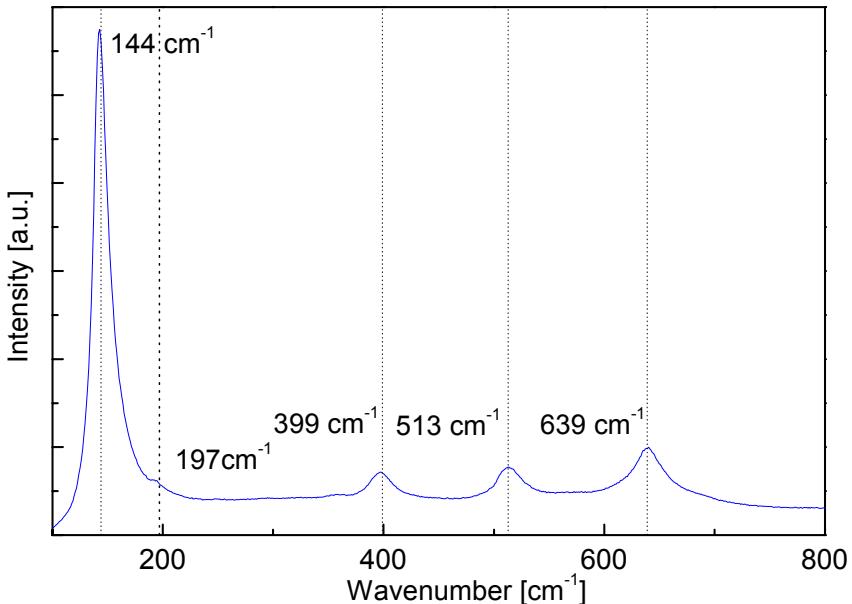

Fig. S2 – Raman spectra of the as-prepared TiO_2 nanorods, with standard anatase peaks annotated (144, 197, 399, 513 and 639 cm^{-1})¹

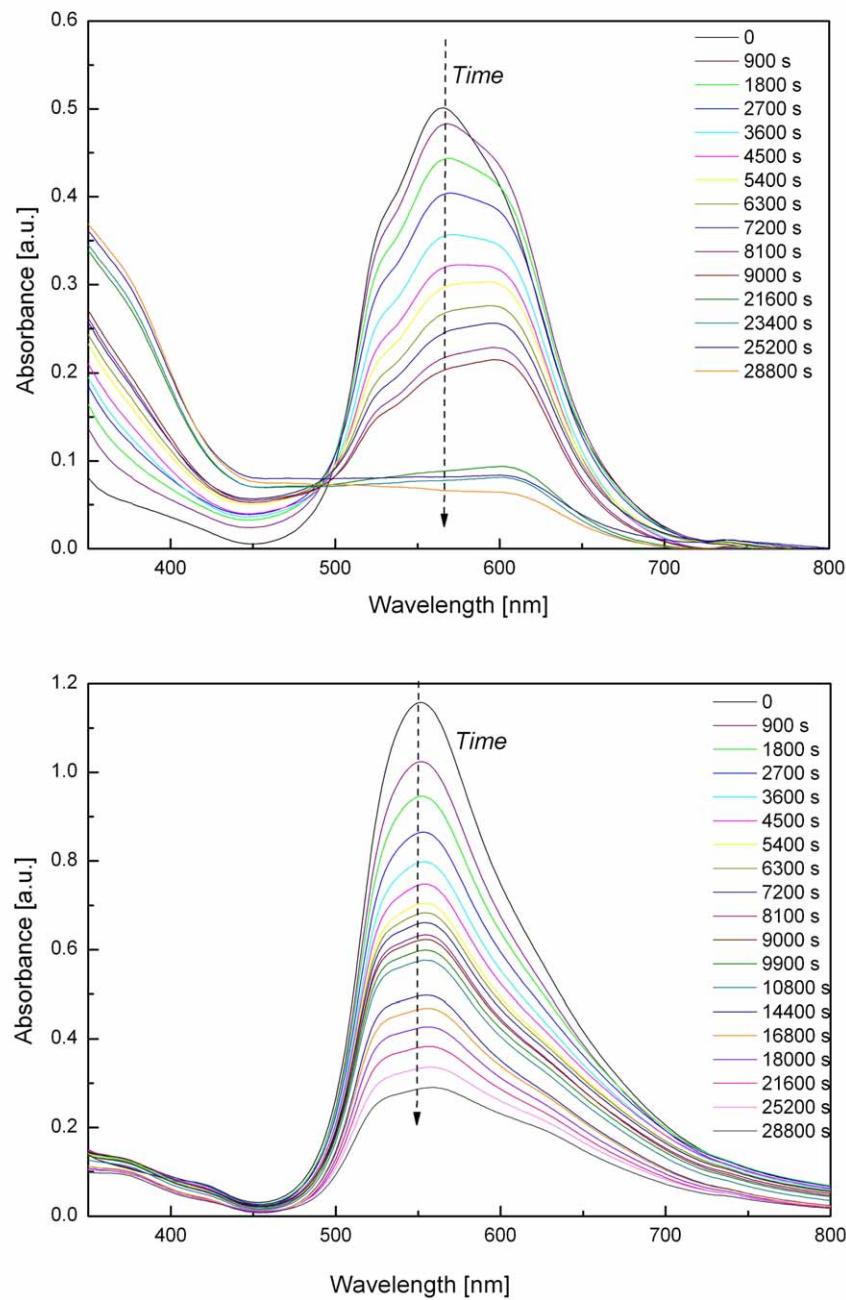

Fig. S3 - UV-Vis spectra of Brilliant Blue R solutions in water at (a) basic pH 12-13 and (b) acidic pH \leq 2, as function of UV-exposure time

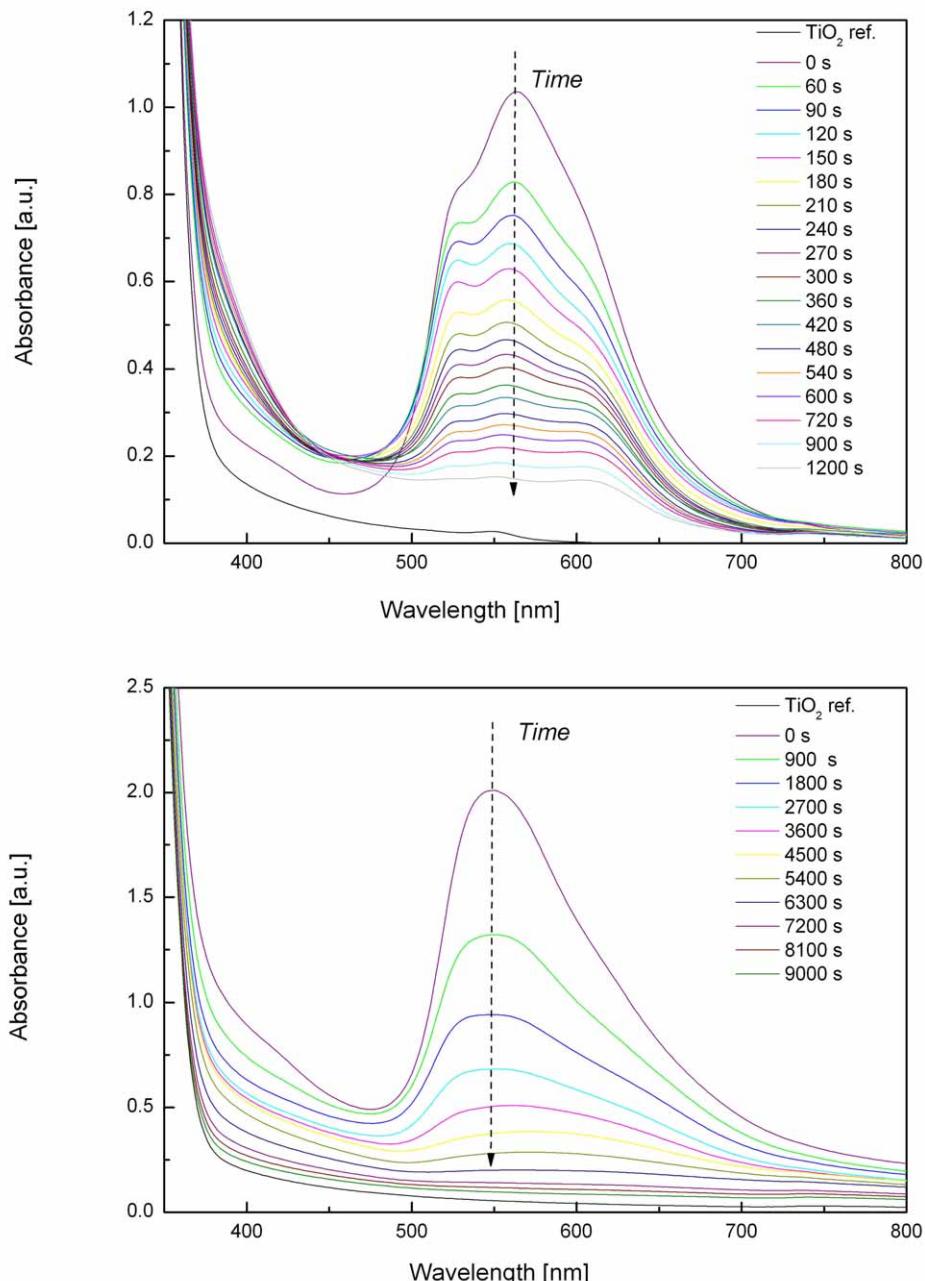

Fig. S4 – UV-Vis spectra of the dye solutions containing (a) pristine, UV-treated TiO_2 nanorods (3 mg ml^{-1}) and (b) APTs-coated TiO_2 nanorods (3 mg ml^{-1}) as a function of irradiation time

Organic-capped TiO_2 nanorods, with higher aspect ratio to those discussed in the paper were also prepared by high temperature, nonhydrolytic routes using TiCl_4 and Ti(OPr)_4 as titania precursors. The surfactant is oleic acid dissolved in heptadecane and the setup and reaction conditions are identical to those for synthesis of TOPO-dodecylamine rods, except that the reaction is split into two 4h segments – a pre-nucleation step at 110°C and a high temperature step at 300°C . The results below are for TiO_2 nanorods grown with oleic acid as SDA (TNR_{OLEA}).

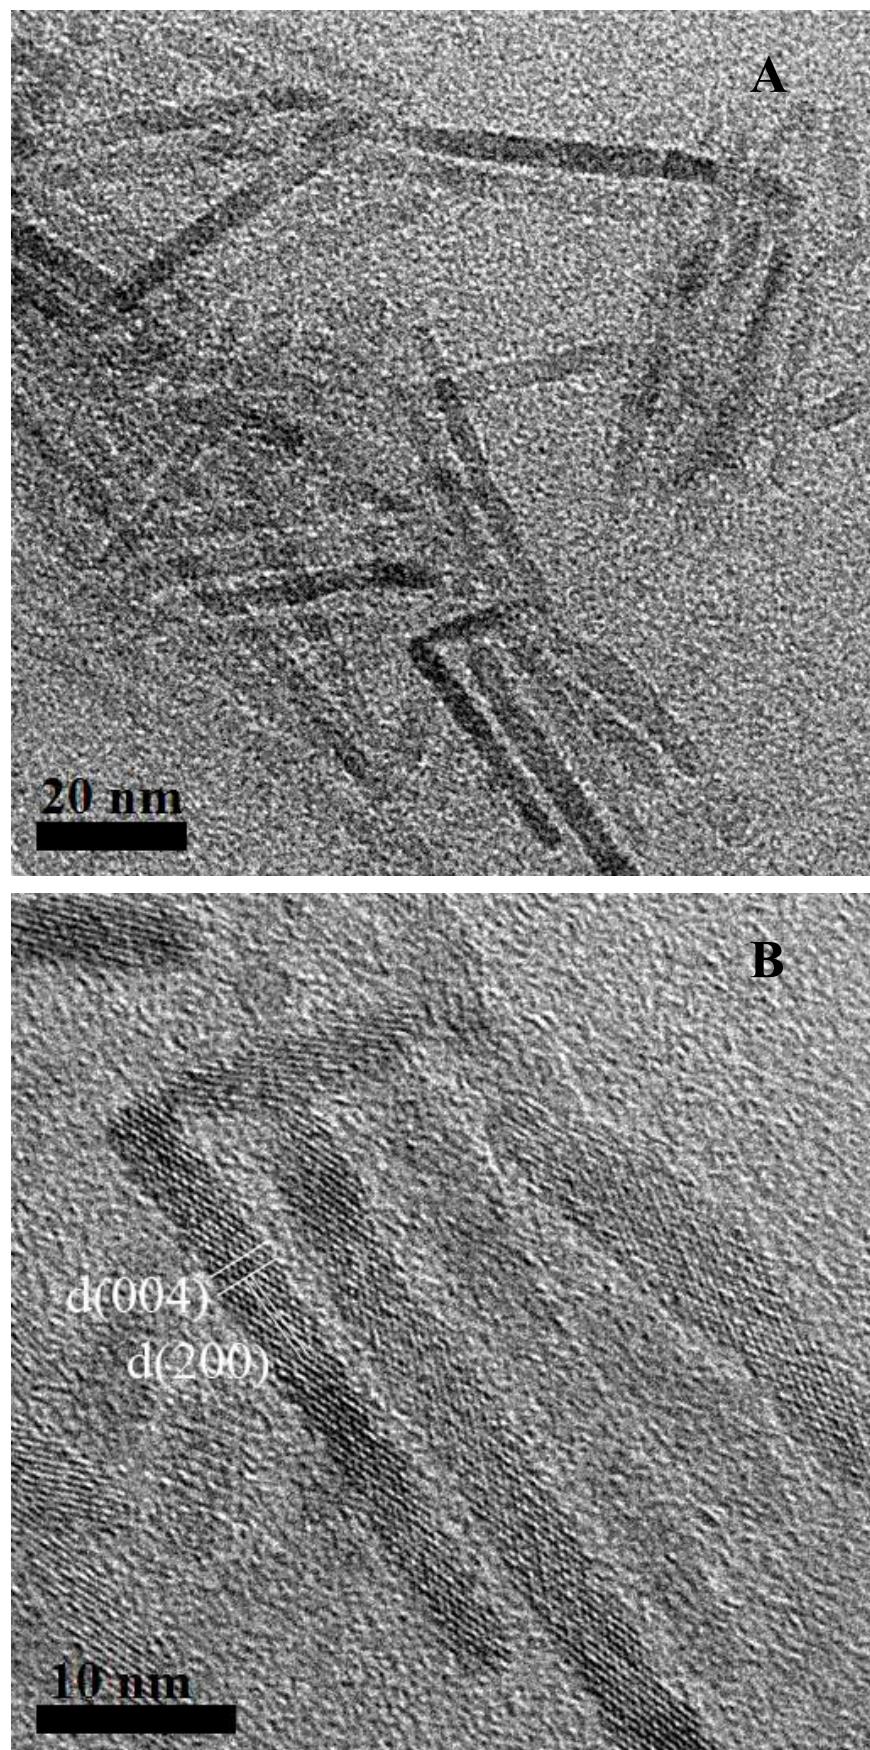

Figure S5 - TEM of TN_ROLEA:
(a) low-resolution micrograph and (b) high-resolution micrograph

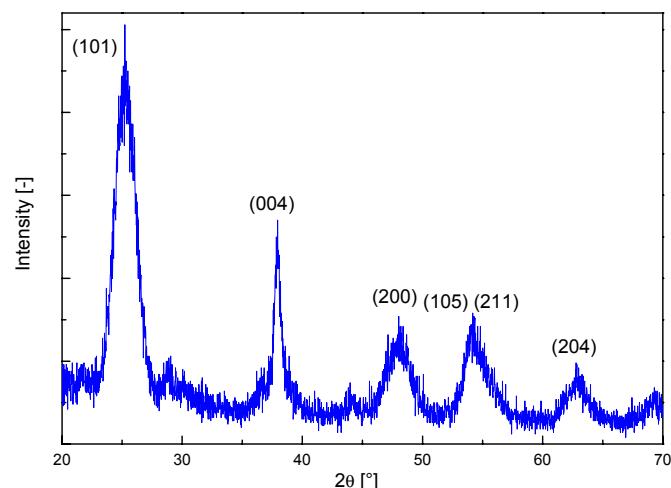

Figure S6 - XRD pattern of TNROLEA

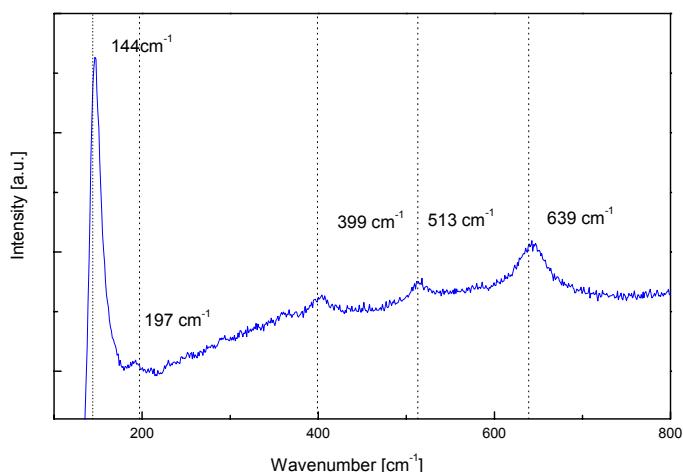

Figure S7 - Raman spectrum of TNROLEA

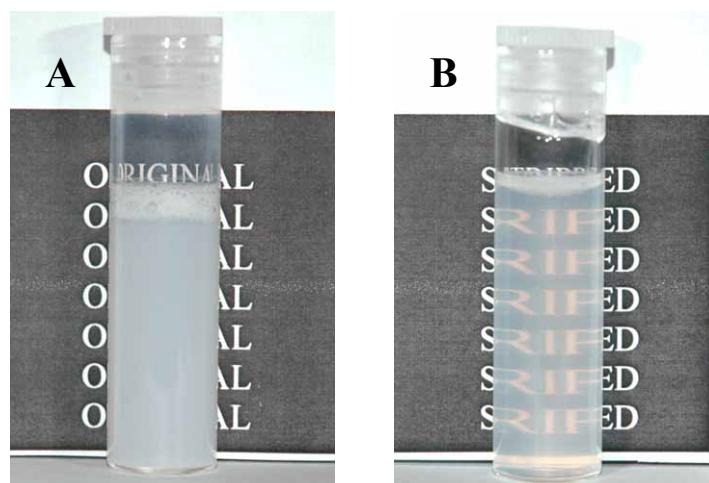

Figure S8 – TNROLEA suspensions in water ($1\text{mg ml}^{-1}\text{ TiO}_2$):
(a) stripped (b) stripped with 200 mM TMAH

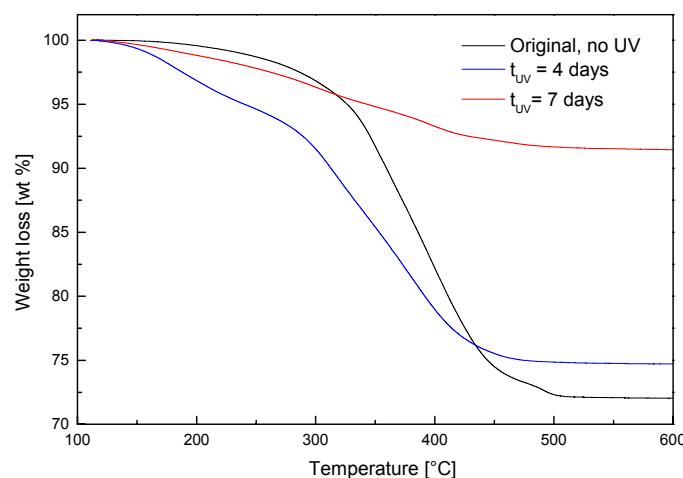

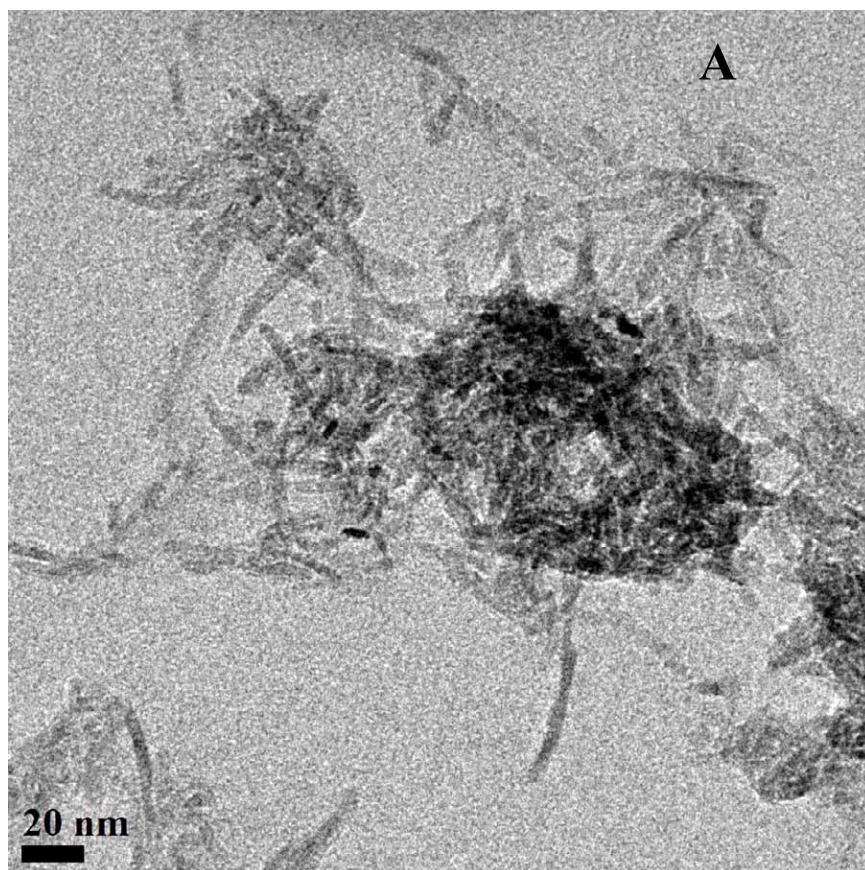

Figure S9 - TGA curves for TNRolea - effect of UV irradiation time

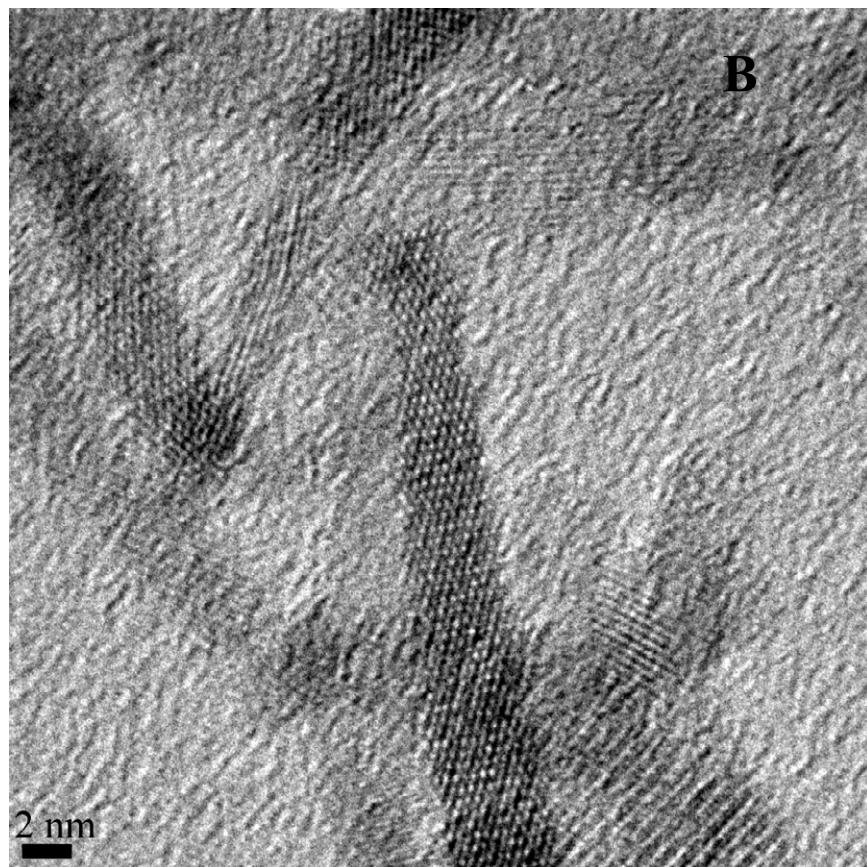

Figure S10 - TEM of stripped TNROLEA:
(a) low-resolution and (b) high resolution micrograph
