

## Electronic Supplementary Information (ESI) Paragraph

**Table S1:** Summary of applied mathematical models together with statistical parameter  $R^2$  for all gel and mesoporous glasses. All models are linearized as:  $y = ax + b$ . a and b parameters were extracted by a least-squares fitting of the experimental UV-Vis results.  $f_t$  and  $f_{\%t}$  represent the fraction and fraction percentage respectively of Curcumin released at time t with respect to the whole quantity of loaded Curcumin on the sample at time 0.

<b>Model</b>	<b>Sample</b>	<b>Equation parameters</b>		
		<i>a</i>	<i>b</i>	$R^2$
<b>Korsmeyer-Peppas</b> $y = \text{Log}(f_{\%t})$ $x = \text{Log}(t)$	SG_curc (0-72 h)	0.3512	0.7901	0.9068
	SG_curc (0-4h)	0.9002	0.5836	0.9827
	SG_curc (12-48h)	0.3014	0.8708	0.9986
	SGGa_curc (0-72 h)	0.6519	0.1359	0.9508
	SGGa_curc (0-4h)	1.268	-0.1116	0.9965
	SGGa_curc (12-48h)	0.6124	0.2165	0.9497
	SGP123_curc (0-12 h)	0.3651	0.9912	0.9748
	SGGaP123_curc (0-12 h)	0.4432	0.8640	0.9131
<b>Weibull</b> $y = \text{Log}(-\ln(1-f_t))$ $x = \text{Log}(t)$	SG_curc (0-72 h)	0.3791	-1.201	0.9183
	SG_curc (0-4h)	0.9344	-1.408	0.9843
	SG_curc (12-48h)	0.3373	-1.132	0.9990
	SGGa_curc (0-72 h)	0.6771	-1.869	0.9560
