5

### Experimental conditions

**Spray drying:** The spray dry apparatus used in this study is a laboratory-made one altered from a Spray Dryer GA32 (Yamato Scientific Co.). Droplets of a precursor solution for SMH\_100 were generated from a two-flow spray nozzle (the diameters of the spray drying nozzles are 406 and 1270  $\mu\text{m}$ ). The droplets were carried by an air flow (250  $^{\circ}\text{C}$ ) and dried in a heating zone. Finally, powdery samples were collected by a cyclone separator.

**Spin coating:** A precursor solution for SMH\_100 was spin-coated on glass substrates at 2000 rpm for 10 seconds and air-dried at room temperature for 2 days.

**Anodic alumina membrane (AAM) templating:** A precursor solution for SMH\_100 was dropped on AAM (Whatman, Anodisc 25, pore diameter ca. 200 nm, thickness 60  $\mu\text{m}$ ) and infiltrated into the AAM channels and air-dried at room temperature for 2 days. The AAM was dissolved by 5 wt %  $\text{H}_3\text{PO}_4$ .
