

Supporting information for

Impact of Regioregularity on Thin-Film Transistor and Photovoltaic Cell Performances of Pentacene-Containing Polymers

Ying Jiang, Sanghyun Hong, Joon Hak Oh, Rajib Mondal, Toshihiro Okamoto, Eric Verploegen, Michael F. Toney, Michael D. McGehee and Zhenan Bao

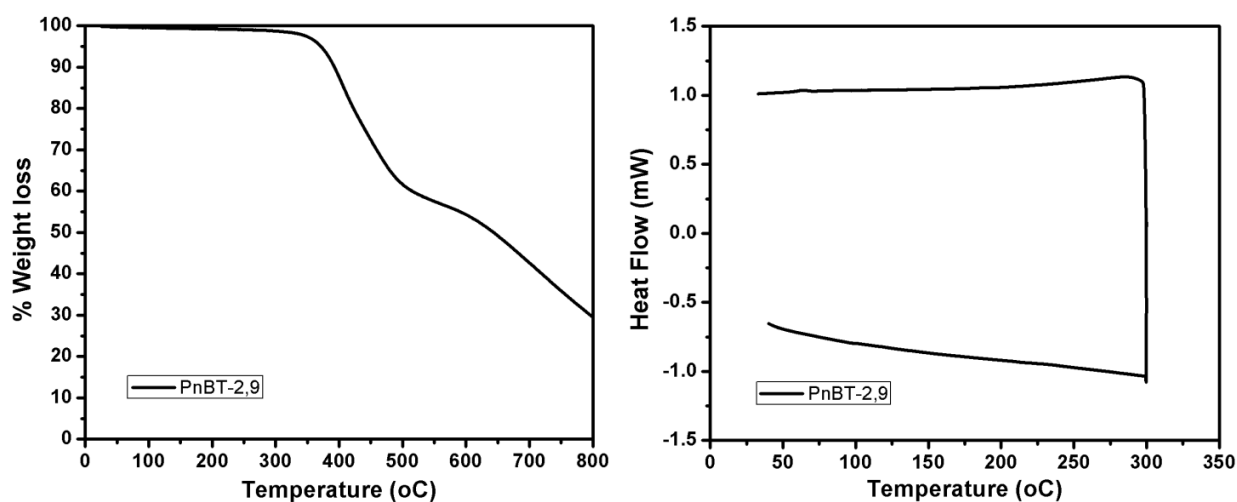

Figure S1. (a) Thermalgravimetric analysis and (b) differential scanning calorimetry thermograph of **PnBT-2,9**.

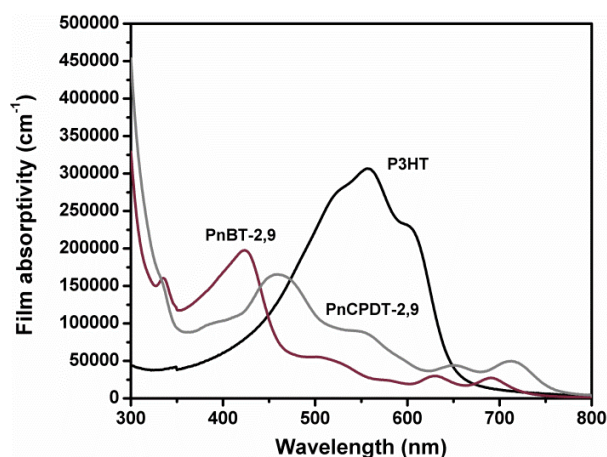

Figure S2. Film absorptivity of **PnBT-2,9** and **PnCPDT-2,9** as compared to P3HT, indicating the pentacene-containing polymers' lower absorptivity. **PnCPDT-2,9** absorbs more intensely in the visible wavelengths than **PnBT-2,9**.

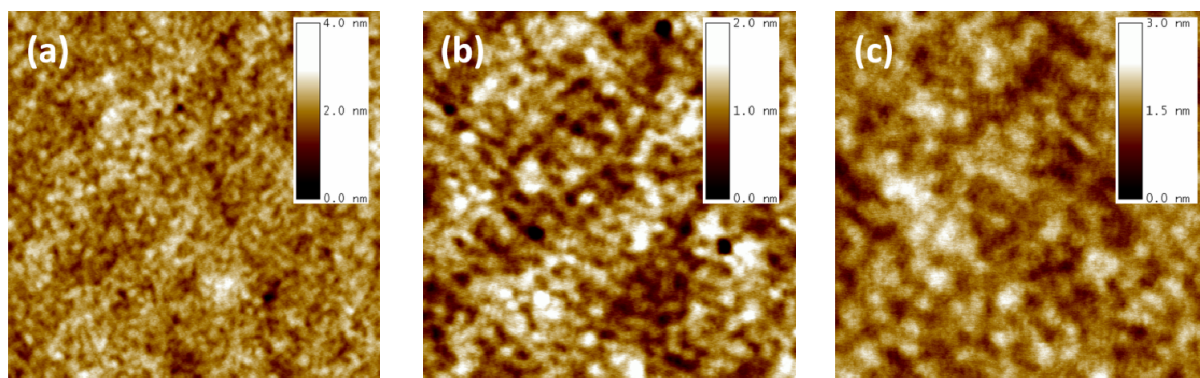

Figure S3. $1\ \mu\text{m} \times 1\ \mu\text{m}$ AFM topographs of (a) **PnCPDT-2,9**; (b) **PnCPDT-2,10**; (c) **PnCPDT-RRa** polymer-PC₇₁BM blend films spin-cast from *o*-DCB at a polymer:PC₇₁BM weight ratio of 1:4.
