### **Table of the Contents**

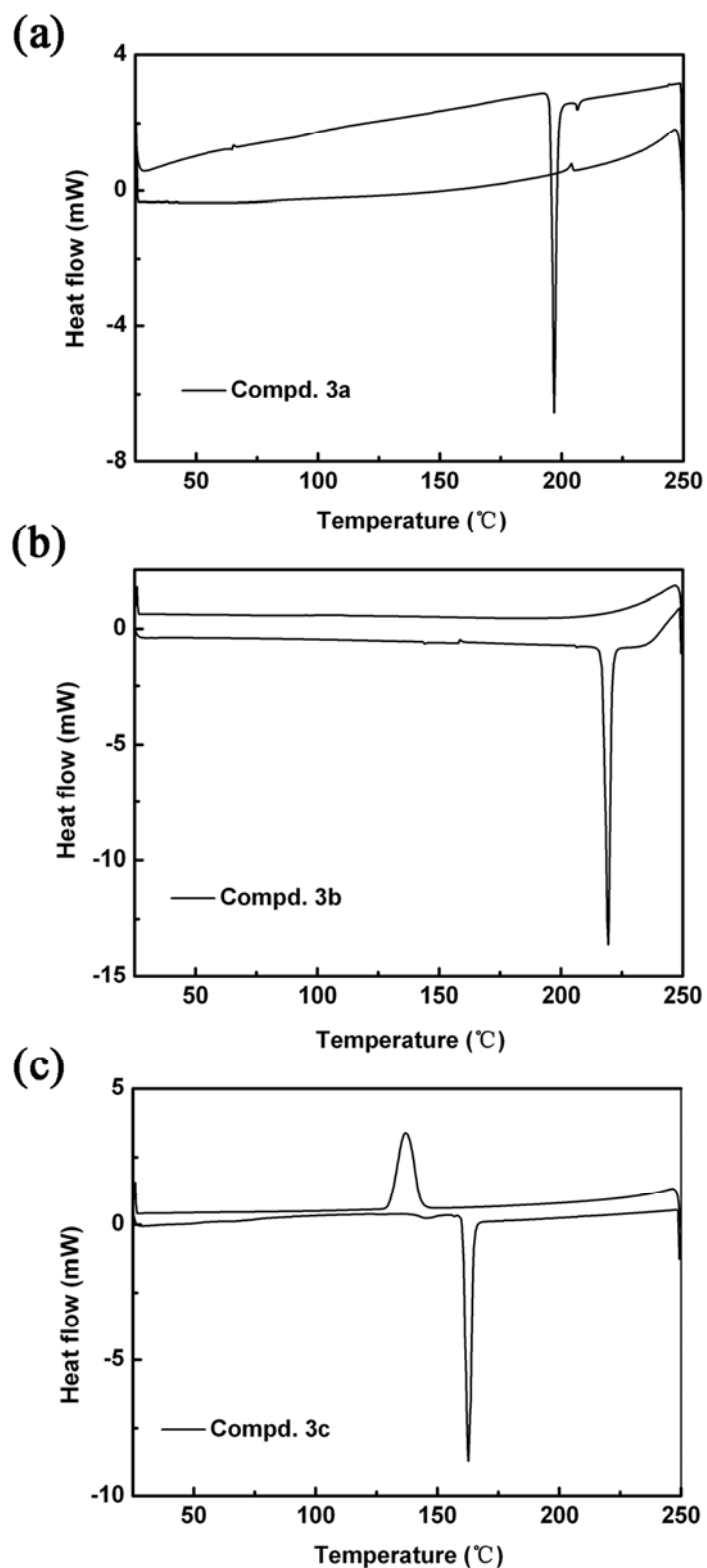

§1. TGA data for derivatives <b>3a-c</b> .....	<b>S2</b>
§2. DSC data for derivatives <b>3a-c</b> .....	<b>S3</b>
§3. Data of X-ray crystallographic analysis.....	<b>S4</b>
§4. UV-vis spectra of thin films.....	<b>S5</b>
§5. Structural isomers in solution state.....	<b>S6</b>
§6. Copies of <sup>1</sup> H NMR and <sup>13</sup> C NMR spectra.....	<b>S9</b>
§7. References.....	<b>S15</b>

## 1. TGA data for derivatives 3a-c

**Fig. S1** Thermal gravimetric analysis (TGA) of compounds **3a-c** performed at a heating rate of  $10\text{ °C min}^{-1}$  under a  $\text{N}_2$  atmosphere with runs recorded from room temperature to  $550\text{ °C}$ .

## 2. DSC data for derivatives 3a-c

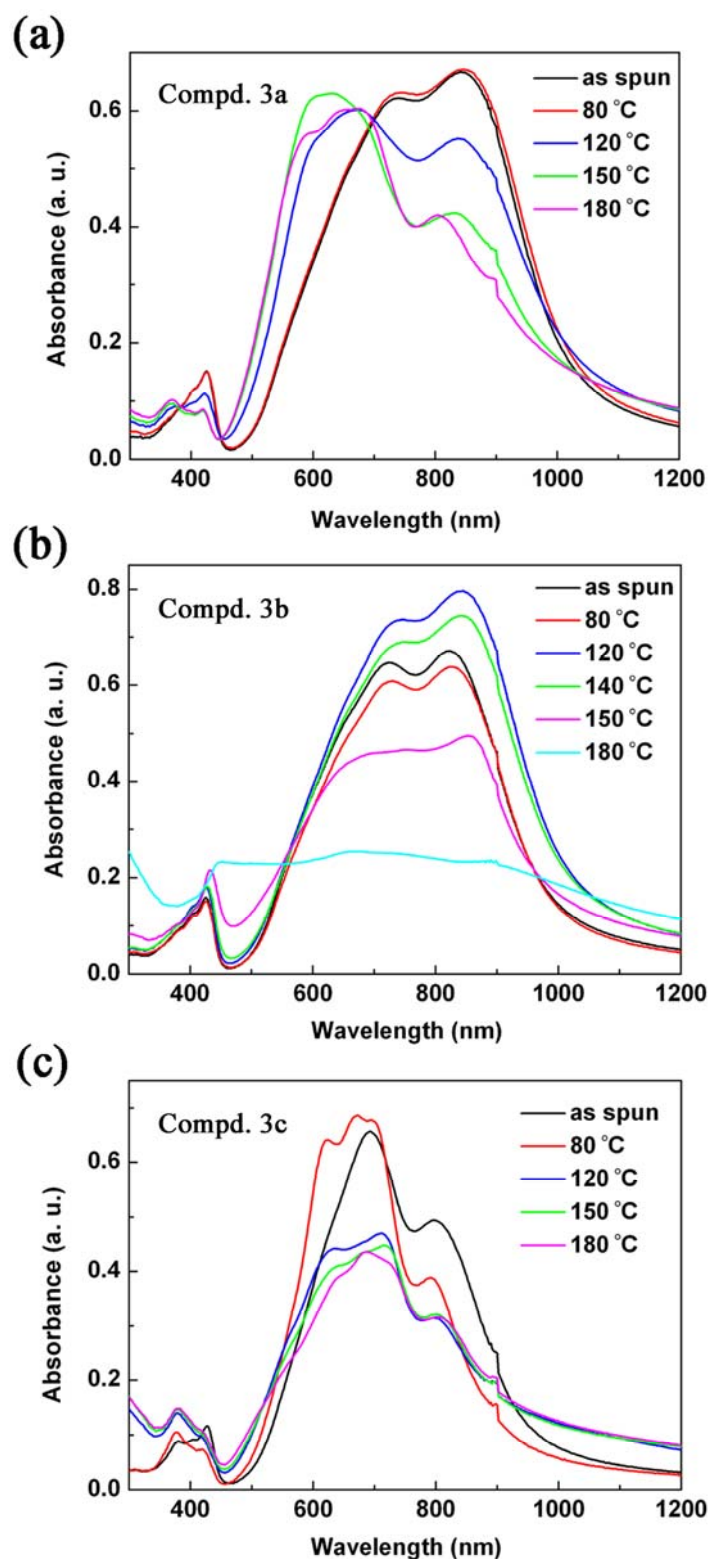

**Fig. S2** Differential scanning calorimetry (DSC) curves of powder of compounds **3a-c** performed under a N<sub>2</sub> atmosphere. Upward peaks indicate exothermic processes, while downward peaks indicate endothermic processes. Scan rate: 10 °C min<sup>-1</sup>.

### 3. Data of X-ray crystallographic analysis

**Table S1.** Crystal data and structure refinement for compound **3b**.

Empirical formula	C <sub>26</sub> H <sub>23</sub> N <sub>5</sub> S <sub>2</sub>
Formula weight	469.61
T/K	173(2)
Wavelength, Å	0.71073
Crystal system	Triclinic
space group	P-1
a, Å	10.463(2)
b, Å	11.737(2)
c, Å	12.856(3)
$\alpha$ , deg	91.16(3)
$\beta$ , deg	105.66(3)
$\gamma$ , deg	114.76(3)
Volume, Å <sup>3</sup>	1364.3(5)
Z	2
Calculated density, Mg/m <sup>3</sup>	1.143
Absorption coefficient, mm <sup>-1</sup>	0.216
F(000)	492
Crystal size, mm	0.42 × 0.28 × 0.24
$\theta$ range, deg	1.66 to 27.46
Limiting indices	-13 ≤ h ≤ 13, -15 ≤ k ≤ 15, -16 ≤ l ≤ 16
Reflections collected / unique	15139 / 6219 [R(int) = 0.0447]
Absorption correction	Semi-empirical from equivalents
Refinement method	Full-matrix least-squares on F <sup>2</sup>
Data / restraints / parameters	6219 / 0 / 298
Goodness-of-fit on F <sup>2</sup>	1.059
Final R indices [I > 2 $\sigma$ (I)]	R <sub>1</sub> = 0.0676, wR <sub>2</sub> = 0.1911
R indices (all data)	R <sub>1</sub> = 0.0736, wR <sub>2</sub> = 0.1971
Largest diff. peak and hole, e.Å <sup>-3</sup>	1.523 and -0.480

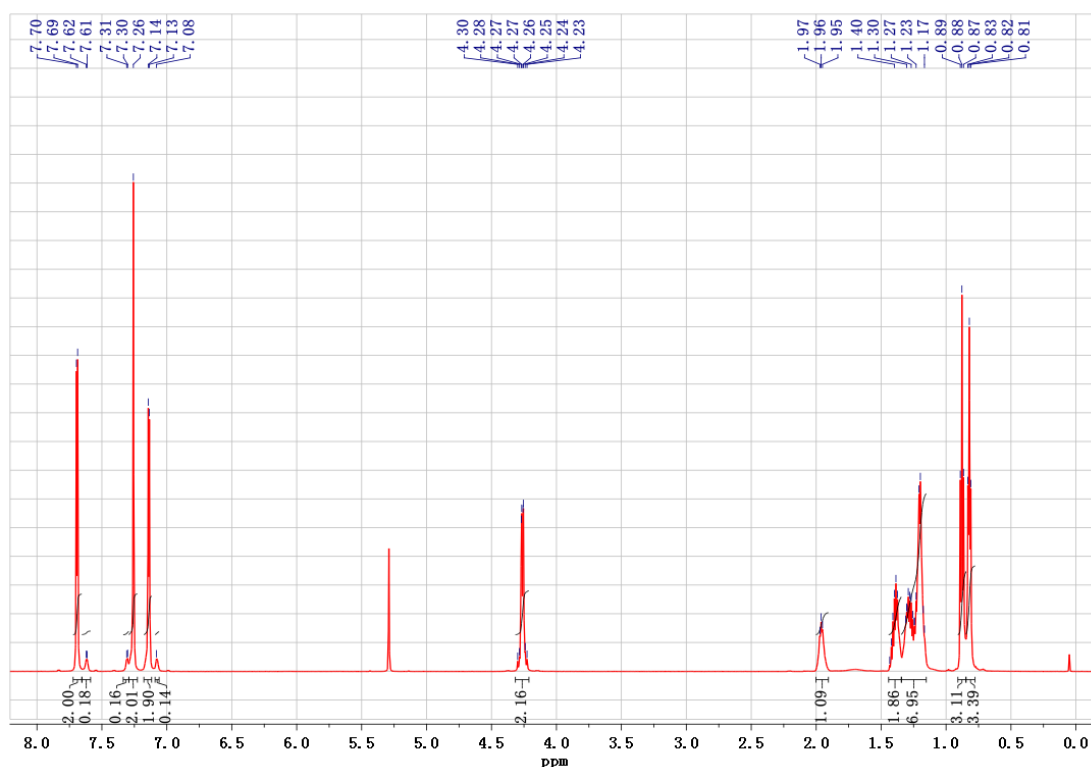

#### 4. UV-vis spectra of thin films

**Fig. S3** UV-vis absorption spectra of thin films of compounds **3a-c** spin-coated on quartz substrates and annealed at different temperatures.

## 5. Structural isomers in solution state

Generally, for oligothiophene-based quinoidal substituted with dicynomethylene, the E/Z isomerism can exist in the thienoquinoidal core parts. Similarly, for our results, we found there are some small  $^1\text{H}$  NMR signals appearing in the aryl portion, which are seemingly signals for impurity, taking compound **3b** as a example, see Fig. S4. However, because the compound was purified by repeated recrystallization and its purity was confirmed by elemental analysis (less than 0.3%), we think there might be some configuration isomers (i.e. *cis-cis*, *cis-trans*, *trans-trans* in terms of the double bonds between thiophene and pyrrole rings, see Fig. S5) co-existing for **3b** in the solution, although data of X-ray crystallographic analysis for **3b** was successfully obtained and the structure for such pyrrole-containing quinoid displays one configuration (*cis-cis*) in the solid state. In order to confirm our consideration about the isomerization phenomenon, NOESY spectrum analysis was carried out: clear correlated peaks between thiophene  $\beta$ -protons  $\text{H}_{\text{b}(\text{b}'\text{'})}$  and methylene protons  $\text{H}_{\text{d}(\text{d}'\text{'})}$  on the first carbon in the alkyl substituent were observed as displayed in Fig. 6 and 7, demonstrating that there are probably two kinds of isomers (eg. *cis-cis* and *cis-trans*) at least co-existing as an equilibrium mixture in the solution.

**Fig. S4** The  $^1\text{H}$  NMR spectrum (600 MHz,  $\text{CD}_2\text{Cl}_2$ ) at 298 K for **3b**.

**Fig. S5** (a) Three isomers for a terthienoquinoid as reported by Takimiya's group<sup>1</sup>, and (b) three possible isomers for **3b** in solution.

**Fig. S6** The <sup>1</sup>H NMR spectrum (600 MHz, CD<sub>2</sub>Cl<sub>2</sub>) at 213 K for **3b**. Note: Isomer with larger proportion is called Part A and the one with much smaller proportion is called Part B; and the assignment of some key hydrogen atoms are indicated.

**Fig. S7** The NOESY spectrum (600 MHz, CD<sub>2</sub>Cl<sub>2</sub>) at 213 K for **3b**. *Note*: Correlation peaks A<sub>1</sub> and A<sub>2</sub> indicate Part A exists as a *cis-cis* configuration; Correlation peaks B<sub>1</sub> and B<sub>2</sub> indicate Part B more possibly exists as a *cis-trans* configuration.

## 6. Copies of $^1\text{H}$ NMR and $^{13}\text{C}$ NMR spectra

Fig. S8  $^1\text{H}$  NMR spectrum of **2a**.

Fig. S9  $^{13}\text{C}$  NMR spectrum of **2a**.

**Fig. S10** <sup>1</sup>H NMR spectrum of **2b**.

**Fig. S11** <sup>13</sup>C NMR spectrum of **2b**.

**Fig. S12** <sup>1</sup>H NMR spectrum of **2c**.

**Fig. S13** <sup>13</sup>C NMR spectrum of **2c**.

**Fig. S14** <sup>1</sup>H NMR spectrum of **3a**.

**Fig. S15** <sup>13</sup>C NMR spectrum of **3a**.

Fig. S16 <sup>1</sup>H NMR spectrum of **3b**.

Fig. S17 <sup>13</sup>C NMR spectrum of **3b**.

Fig. S18 <sup>1</sup>H NMR spectrum of 3c.

Fig. S19 <sup>13</sup>C NMR spectrum of 3c.
