## General Experimental

All reagents were purchased from Sigma-Aldrich (Dorset, U.K.) and used without further purification unless otherwise specified. All reactions were carried out in freshly dried and distilled solvents under a dry nitrogen atmosphere apart from those involving aqueous solutions. NMR spectra were recorded on Bruker Avance III 400 MHz or 500 MHz NMR spectrometers. Data are expressed in parts per million downfield from $\mathrm{SiMe}_{4}$ as an internal standard or relative to $\mathrm{CHCl}_{3}$. NMR assignments were supported by ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ NMR 2D spectra and DEPT for compound 4-7 and caged aldehyde 1'. J vales are given in Hz. IR spectra were measured on a Perkin Elmer Spectrum RXI FT-IR spectrophotometer and reported as $\mathrm{cm}^{-1}$. Mass spectra were obtained using Bruker micrOTOF spectrometers in electrospray positive ion mode.

4-(Dimethylamino)-2-(hydroxydiphenylmethyl)phenol (2) was prepared according to the synthetic route described by Wang et al. ${ }^{1}$

## 4-Bromobutanal (3)

DMSO ( $0.50 \mathrm{~mL}, 6.44 \mathrm{mmol}$ ) in dichloromethane ( 4 mL ) was added to oxalyl chloride ( 0.41 mL , 4.57 $\mathrm{mmol})$ in dichloromethane $(4 \mathrm{~mL})$ at $-78^{\circ} \mathrm{C}$. After 5 minutes a solution of 4-bromo-1-butanol ( $0.68 \mathrm{~g}, 4.44$ $\mathrm{mmol})$ in dichloromethane ( 8 mL ) was added to the mixture and after 10 minutes, $N, N-$ diisopropylethylamine ( $2.50 \mathrm{~mL}, 14.33 \mathrm{mmol}$ ) was added. The solution was stirred at $-65^{\circ} \mathrm{C}$ for 15 minutes and for an additional 15 minutes at room temperature, poured into $10 \%$ citric acid and extracted with dichloromethane ( $3 \times 30 \mathrm{~mL}$ ). The organic layer was washed with saturated $\mathrm{NaHCO}_{3}(30 \mathrm{~mL})$ and dried over $\mathrm{MgSO}_{4}$. The solution was evaporated to dryness and the residue purified by silica column chromatography ( $1: 4$ dichloromethane $/$ hexane) to yield compound $3\left(0.54 \mathrm{~g}, 80 \%\right.$ ) as a colourless oil; $R_{\mathrm{f}} 0.45$ (1:1 dichloromethane/hexane); $\delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{Me}_{4} \mathrm{Si}\right)$ 2.15-2.22 ( 2 H , quintet, $\mathrm{CH}_{2}$ ), 2.65-2.68 ( $2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right)$, 3.44-3.47 ( $2 \mathrm{H}, \mathrm{t}, J=6.0, \mathrm{CH}_{2}$ ), $9.81(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO})$. Spectroscopic data are consistent with those described in the literature. ${ }^{2}$
