Cells, which had been grown under normal conditions and then incubated in the presence ($50 \mu\text{g ml}^{-1}$) or absence of novobiocin at 34°C for 30 min, were incubated at 44°C for 30 min. Each value indicates the ratio of the level of the transcript in heat-stressed cells in the presence of novobiocin to that in heat-stressed cells in the absence of novobiocin. The numbering of open reading frames (ORFs) corresponds to that in the database on the Cyanobase website (<http://bacteria.kazusa.or.jp/cyano/Synechocystis/>). This table lists the heat stress-inducible genes with induction factors higher than 4.0 in control cells (average of values from 2-3 independent experiments). The entire list can be accessed at http://www.genome.jp/kegg-bin/get_htext?htext=Exp_DB&hier=1. Genes that had been used as probes in Northern blotting are underlined. IF – induction factor; NB – novobiocin. The table represents the results of two independent experiments.
