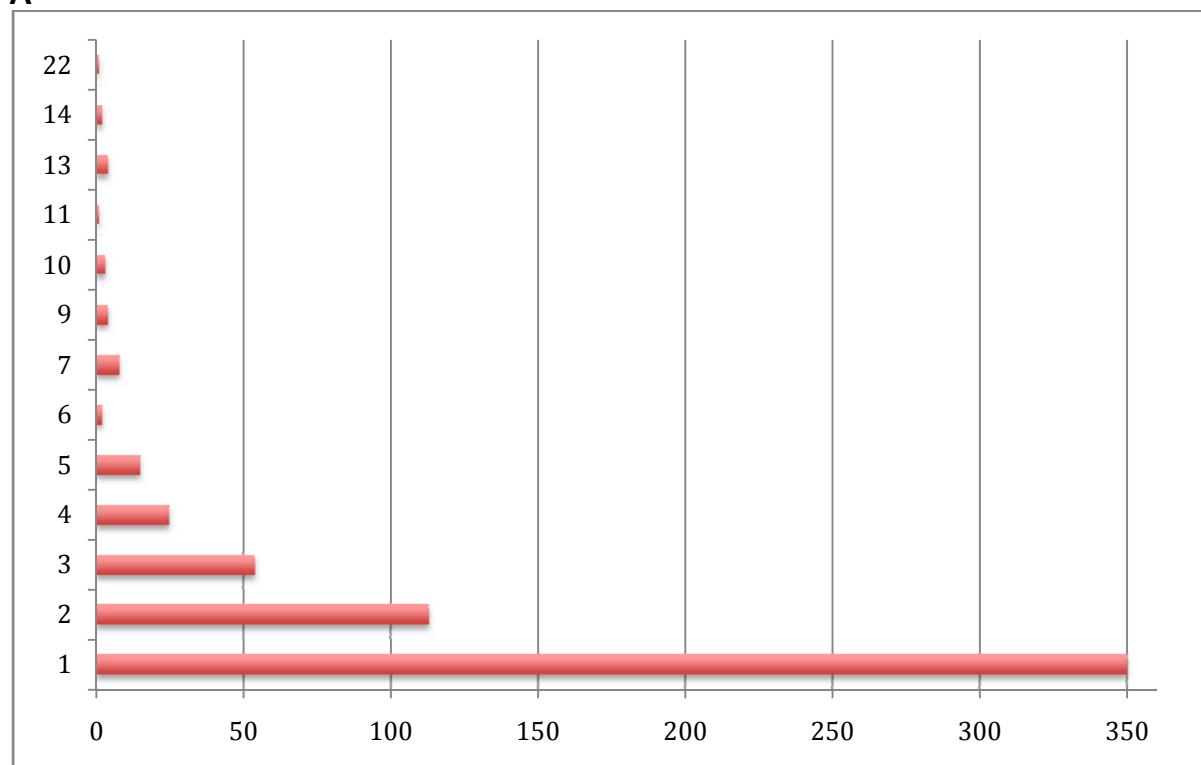

Fig. 1

A: The rate of appearance of individual miRNAs against the background of publications citing miRNAs. Rate of publication of novel miRNAs over time (green) compared to the incidence of all publications that refer to miRNAs (red). Novel miRNAs are plotted as preferred terms to unify all morphological variants under single identifiers. A logarithmic scale was used to unify both data sets on one graph.

B: Histogram of occurrence of major morphological stems for all miRNAs. Term-frequency analysis was used to analyze all miRNA-stems identified during text mining. Numerical designations were truncated and omitted from analysis. Species and other specific prefixes were included in our analyses.

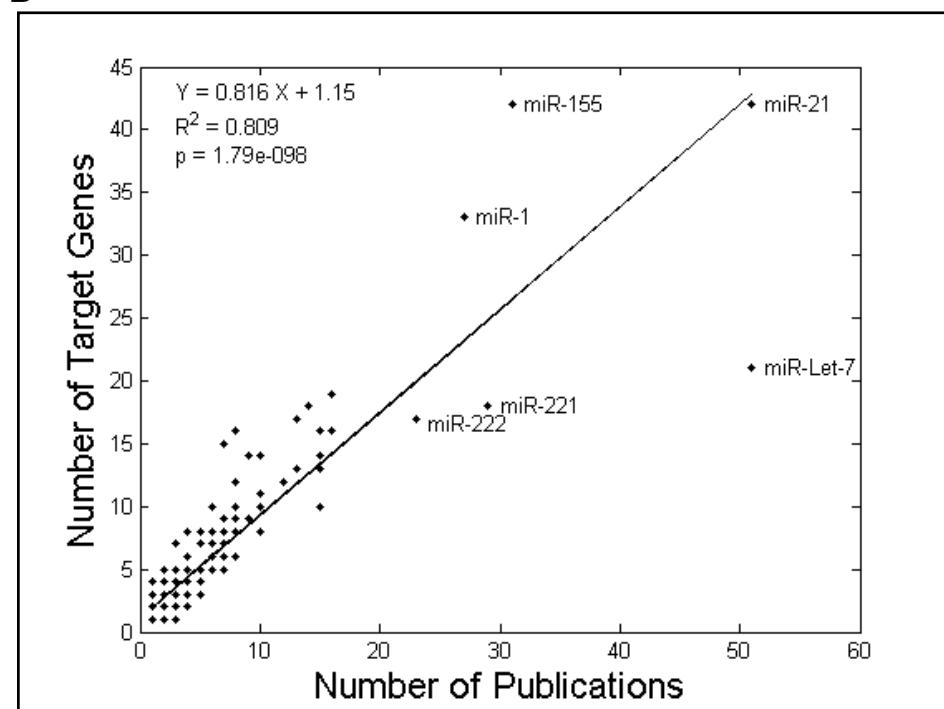

Fig. 2

A: Incidences of genes targeted by individual miRNAs. Histogram corresponding to binned sets of genes targeted by individual miRNAs, each bar represents a bin of genes (y-axis) targeted by a specific number of miRNAs (x-axis), in general most miRNAs targeted few genes with a small number of individual miRNAs having a wide range of targets.

B: Graph illustrating the relationship between the frequency of publication of individual miRNAs and the number of gene targeted by that miRNA. Each point on the graph represents an individual miRNA (as preferred term). We observed a correlation between publication rate and number of gene targets, with a correlation coefficient of 0.816 (R^2 is 0.0.809) and p-value of 1.79e-98.

Table 4a: Top 20 KEGG Pathways

No of genes is the number of miRNA target genes found in the KEGG pathway. A p-value cut-off of 0.05 was used to determine enrichment KEGG pathways. The top 20 pathways were selected on the basis if p-value rank.

Table 4b Top 20 PANTHER Biological Processes

of genes is the number of miRNA target genes found in the BP category, Freq (%) describes the distribution of miRNA target genes across all PANTHER BP categories. A p-value cut-off of 0.05 was used to determine enrichment of hits in the MF category against randomly generated sets of genes found in literature.
