

Supplemental data

Table S1: Overview of all identified proteins found in the ACN dataset. All identified proteins contain at least one unique peptide and the overall protein score ($-10\log P$) must be higher than 20 ($FDR < 5\%$) to be selected as a confident identification.

Table S2 : Overview of all quantified proteins found in the ACN dataset. In order to be selected as quantified protein, reporter intensities of each of the six reporter ions should be available.

Figure S1: Heatmap of quantified proteins. Trends in upregulation of tumor samples (TMT 127,129,131) can be seen compared to control colon mucosa (TMT 126,128,130).
