

## Altered transition metal homeostasis in Niemann-Pick disease, Type C1

Ya Hui Hung, Noel G. Faux, David W. Killilea, Nicole Yanjanin, Sally Firnkes, Irene Volitakis, George Ganio, Mark Walterfang, Caroline Hastings, Forbes D. Porter, Daniel S. Ory, and Ashley I. Bush

**Figure S1** Representative western blot of plasma CP in (A) P21 ( $n = 5$ ) and (B) P49 ( $n = 18$ ) *Npc1<sup>-/-</sup>* and wild-type (WT) littermate control mice. Detection of total, apo- and holo-CP was achieved by differential sample preparation prior to separation by SDS-PAGE. For total CP detection, samples were heated 95°C, 5 min prior to separation by SDS-PAGE. For apo- and holo-CP differentiation, the samples were not heated. Samples from CP knockout and matched WT control were included as negative and positive controls, respectively.

**Figure S2** Representative western blots of (A) CSF ( $n = 21$ ) and (B) plasma CP from human NP-C patients ( $n = 40$ ) and healthy controls (HC;  $n = 41$ ). Detection of total, apo- and holo-CP was achieved by differential sample preparation prior to separation by SDS-PAGE. For total CP detection, samples were heated 95°C, 5 min prior to separation by SDS-PAGE. For apo- and holo-CP differentiation, the samples were not heated.

**Table S1** Metal analysis of various tissues from P49 female *NpcI*<sup>-/-</sup> (BALB/c *NpcI*<sup>nih</sup>) and wild-type (WT) littermate control (BALB/c) mice ( $\mu\text{g/g}$  wet tissue weight). All data are presented as mean  $\pm$  S.E.M. (n = 14/genotype). Unpaired *t*-test, two-tailed.

Tissue	Metal	Genotype				<i>p</i>		
		WT		<i>NpcI</i> <sup>-/-</sup>				
Cerebellum	Mn	0.45	$\pm$	0.01	0.56	$\pm$	0.01	<0.0001
