

Supplementary Table S1. The key enzymes for autotrophic growth in *C. metallidurans*

Name	Rmet-number	Spec.	Predicted Mass, (kDa)	Determined Mass, (kDa)
		Activity		
HOS	Rmet_1522 to Rmet_1525	28.7	65.2, 25.4, 23.4, 52.8 = 166.8	62.4±1.8, 26.4±1.3, 24.0±0.6, 54.1±2.5, =235±20 ^a
HOP	Rmet_1297, Rmet_1298,	67.0	69.0 + 38.6 = 108	148±24 ^a
CAX	Rmet_1500, Rmet_1501	2.82	8 * (13.6 + 52.5) = 529	475±36 ^a
PRK	Rmet_1512	0.994	8 * 32.4 = 259	256±11 ^a

^aMean value of masses determined by S300 size exclusion chromatography and sucrose gradient centrifugation. HOS, NAD-reducing soluble hydrogenase; HOP, membrane-bound hydrogenase; CAX, ribulose-bis-phosphate carboxylase/oxygenase; PRK, phosphoribulokinase. Specific activity in U/mg protein.

Supplementary Table S2. Genes expressed differently in AE104 compared to CH34 wild type^a

Operon Region	Name	Gene	Q	D	Description
UP					
Op1321r	Rmet_4594	<i>zntA</i>	1.72	2.88	Q1LEH0 Heavy metal translocating P-type ATPase

^aCells of wild type strain CH34(pMOL28, pMOL30) and its plasmid-free derivative strain AE104 were cultivated in TMM minerals salts medium without further additions on gluconate to the exponential phase of growth. RNA was isolated, reversely transcribed, labeled and hybridized against a CH34-specific gene array. Provided are the Q-ratios AE104/CH34, red if at least 2-fold down-regulated, green up, bold-faced letters indicate significant differences, letters in italics not significant differences. The D-value for each comparison is also given. This is the distance of both mean values divided by the sum of both deviations. If $D > 1$ (the deviation bars do not touch or overlap) the data points are different with a probability in the t-test of $> 95\%$. Three biological repeats for both strains. Genes associated to catabolic metabolic genomic islands (CMGIs) are on a yellow ground with the CMGI number directly above the respective gene(s), operon regions are in a box.

Supplementary Table S3. Genes expressed differently in AE104 in the presence of 100 μ M Zn(II)^a

Operon	Region	Name	Gene	Q_AE104_Zn	D	Description

^aCells of strain AE104 was confronted with 100 μ M zinc chloride for 10 min or not, RNA was isolated, reversely transcribed, labeled and hybridized against a CH34-specific gene array. Provided are the Q-ratios \pm Zn for, red if at least 2-fold down-regulated, green up, bold-faced letters indicate significant differences, letters in italics not significant differences. The D-value for each comparison is also given. This is the distance of both mean values divided by the sum of both deviations. If $D > 1$ (the deviation bars do not touch or overlap) the data points are different with a probability in the t-test of $> 95\%$. Three biological repeats. Genes in operon regions or adjacent operon regions are in a box. Regions with a gene up- or down-regulated at least four-fold are on a green ground. A yellow ground indicates genes of interest, e.g. hydrogenase genes.

Supplementary Table S4. Genes specifically up- or down-regulated in the comparison $\Delta zupT/$ AE104 under EDTA and/or zinc stress^a.

^aCells of strain $\Delta zupT$ and its parent AE104 were confronted with 50 μ M EDTA or 10 μ M zinc chloride until the turbidity reached 100 Klett units, RNA was isolated, reversely transcribed, labeled and hybridized against a CH34-specific gene array. Provided are the Q-ratios $\Delta zupT$ /AE104 for both treatments, red if at least 2-fold down-regulated, green up, bold-faced letters indicate significant differences, letters in italics not significant differences. The D-value for each comparison is also given. This is the distance of both mean values divided by the sum of both deviations. If $D > 1$ (the deviation bars do not touch or overlap) the data points are different with a probability in the t-test of $> 95\%$. Three biological repeats for AE104, two for the mutant strain. Genes associated to catabolic metabolic genomic islands (CMGIs) are on a yellow ground and in a box.

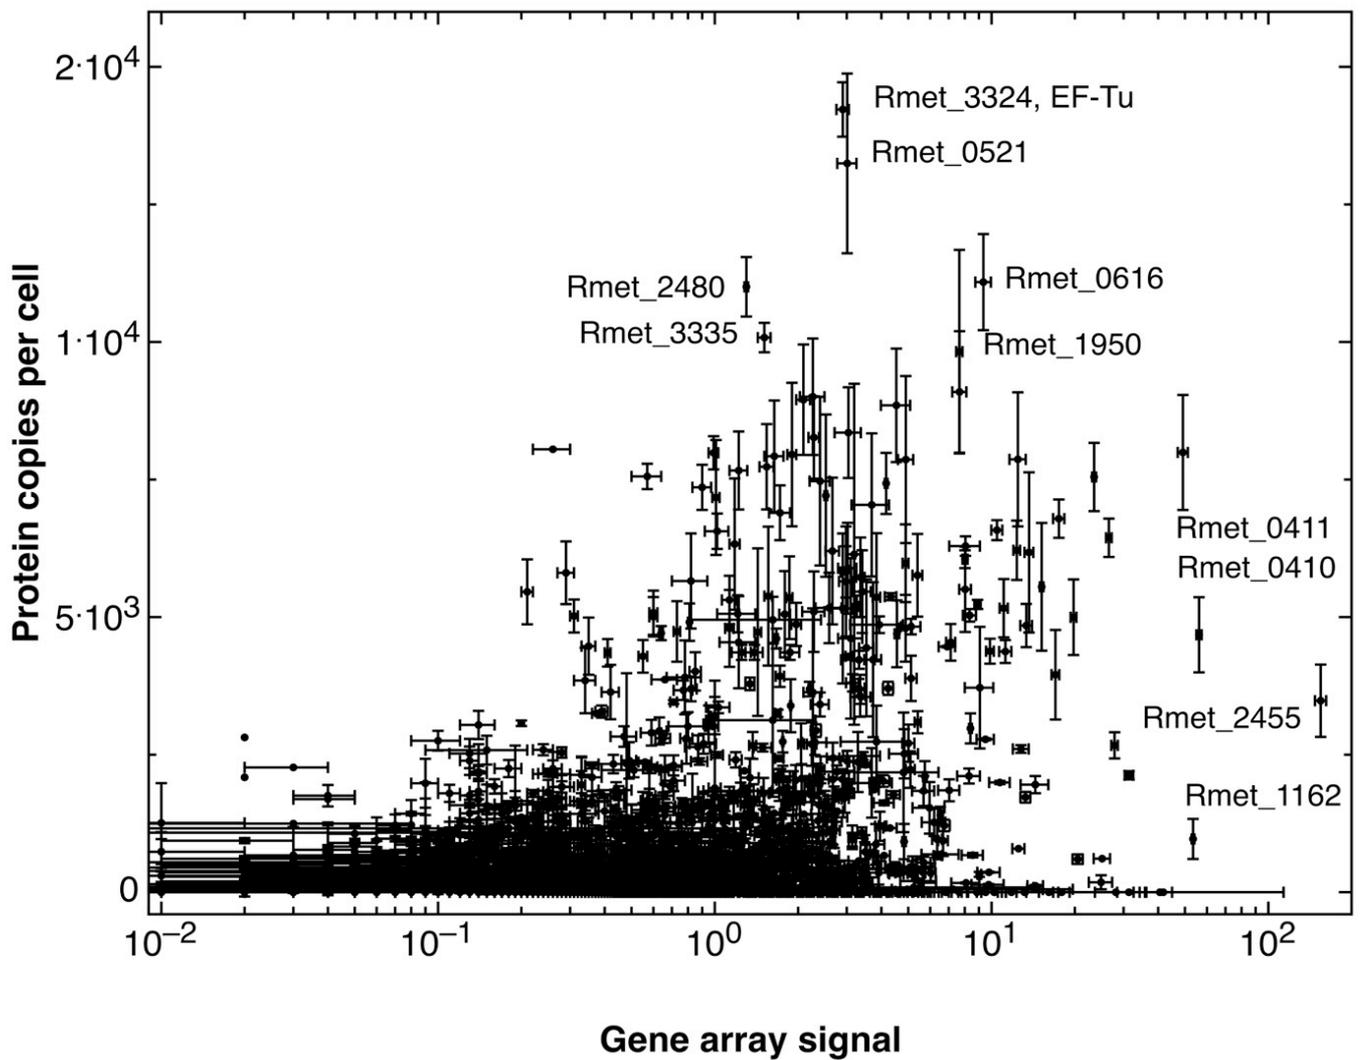

^bAn operon region was defined as adjacent genes in the same direction of transcription without interruption and all genes of the *C. metallidurans* genome were assigned to operon regions Op0001f on chromosome 1 to Op1929r on pMOL28 with “f” or “r” giving the direction of transcription.

Supplementary Table S5. Activity of *zupTp* and *cobW1p* promoters as determined with a *gfp* fusion *in trans* in various *C. metallidurans* strains^a.

	<i>zupTp-gfp</i>						<i>cobW1p-gfp</i>

A *gfp* fusion plasmid was constructed on the basis of plasmid pBBR_MCS2 and designated pBBR-GFP13. Fragments containing the promoter regions of *zupT* and *cobW1* were cloned upstream of the promoterless *gfp* gene). The resulting plasmids were transferred by conjugation into the *C. metallidurans* strains CH34 wild type, its plasmid-free derivative AE104, and the AE104 mutants $\Delta zupT$, $\Delta e4$ ($\Delta zntA \Delta cadA \Delta fieF \Delta dmeF$), $\Delta e4 \Delta zupT$, and Δzur (= $\Delta furC$). The negative control contained just plasmid pBBR-GFP13. The cells were

incubated in TMM containing various concentrations of EDTA or zinc chloride and the specific activity of the GFP fluorescence was calculated in nmol per μg dry weight. There was no difference of the specific activities from the negative controls, which always gave 11.27 ± 3.97 nmol/ μg . To obtain the basal expression levels, the specific fluorescence activity coming from the promoter fusions were divided by this background value coming from the negative controls and the D-value was calculated as a measure of significance ($D = \text{absolute distance of the mean values divided by the sum of the deviations}$, if $D > 1$, the differences are significant if $n \geq 3$). Bold basal values indicate $D > 1$, green and bold values additionally a ratio > 2 . Since the values resulting from cultures incubated without added zinc should be similar to those coming from cultures without added EDTA, another control for the integrity of the data was obtained. Secondly, all values coming from cultures with added zinc or EDTA were compared to the respective basal levels, indicating up- or down-regulation. Again, $D > 1$ is indicated by bold-faced numbers, green means more than 2-fold up-regulation and red more than 2-fold down-regulation with respect to the associated basal level value obtained for TMM without additions. Repeats (n) between 3 and 14.

Supplementary Figure S1. Comparison of transcriptome and proteome data. The spot densities from a gene array experiment with strain AE104 cells ($n = 3$, overall density of the array normalized to 10,000 arbitrary gene-specific and intergenic RNAs per cell) cultivated in TMM without additions were compared to the number of proteins per cell obtained from the same strain cultivated under the same conditions. Deviation bars for both axis are given. The position of a few proteins versus their gene array signals are labeled.
