1. Chemicals:

The nanopolyoxometalates crystal $\text{Na}_6(\text{NH}_4)_4[(\text{Mn}(\text{H}_2\text{O})_3)_2(\text{WO}_2)_2(\text{BiW}_9\text{O}_{33})_2]$ ($\{\text{Mn}_2\text{Bi}_2\text{W}_{20}\}$) was synthesized according to the reported method by B. Krebs (*J. Am. Chem. Soc.* 1998, **120**, 7252). Dioctadecyldimethylammonium chloride ($\text{C}_{38}\text{H}_{80}\text{ClN}$, DODMACl) was purchased from Fluka. $\text{AuCl}_3 \cdot \text{HCl} \cdot 4\text{H}_2\text{O}$ (HAuCl_4 , analytical reagent, $\geq 47.8\%$) and KNO_3 were purchased for use. Rhodamine 6G (R6G) (high purity, 98%) was purchased from Aladdin. Triple distilled water was used to prepare solutions.

2. Experimental Procedures

Electrochemical Properties of Gold–Filled Honeycomb Film: Gold nanoparticles were beforehand electrodeposited on ITO–coated glass with the honeycomb film template. The above prepared ITO–coated glass was the working electrode. Pt plate and saturated calomel electrode (SCE) were counter electrode and reference electrode,

respectively. Pure nitrogen was bubbled for 15 min before measurement to remove the dissolved oxygen. Cyclic voltammetry (CV) was carried out in a 0.1 M KNO₃ aqueous solution from -0.6 V to 1.4 V at the different scan rate at room temperature.

Morphologies Observation: The morphologies were observed on a field-emission scanning electron microscope (FE-SEM, HITACHI, S4800) and an atomic force microscopy (AFM, Digital Instruments, NanoScope IIIa) in a contact mode.

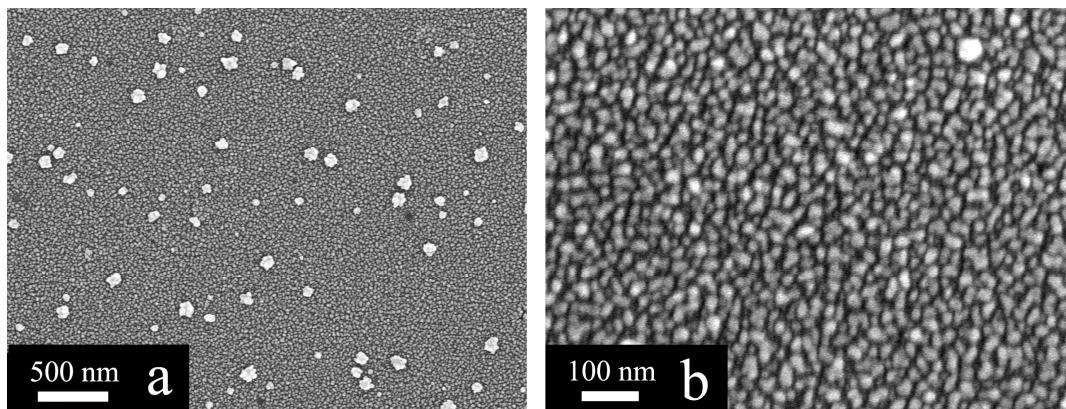

Fig. S1 SEM images (a) of gold nanoparticles electrodeposited on bare ITO-coated glass without the honeycomb film templates, and (b) magnified image of the close-packed surface in (a).
