Figure S-1. Packing mode of Ir(piq)₃ molecules along (1 0 0) face in crystal cell of the single crystals and the nanobelts.

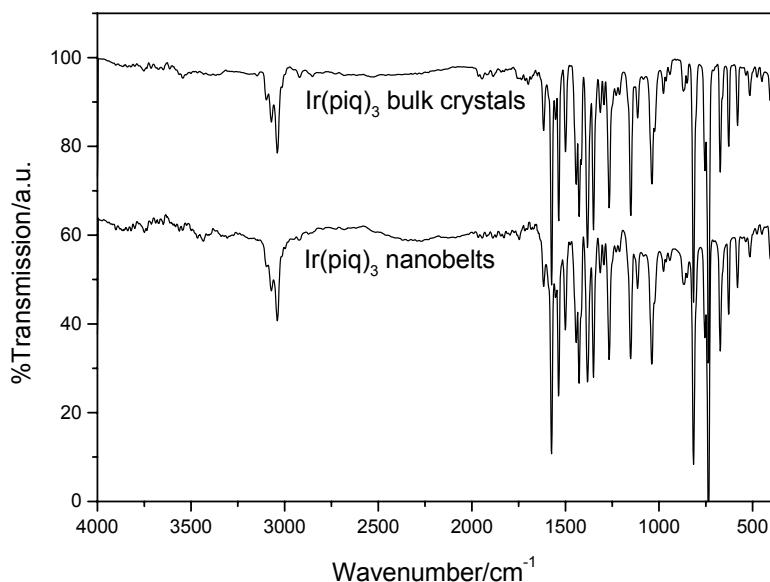

Figure S-2. FT-IR spectra of the as-prepared Ir(piq)₃ nanobelts and Ir(piq)₃ bulk crystals, indicating that no chemical modification of Ir(piq)₃ molecules occurred in the as-obtained nanobelts during the recrystallization process in hot solvent.

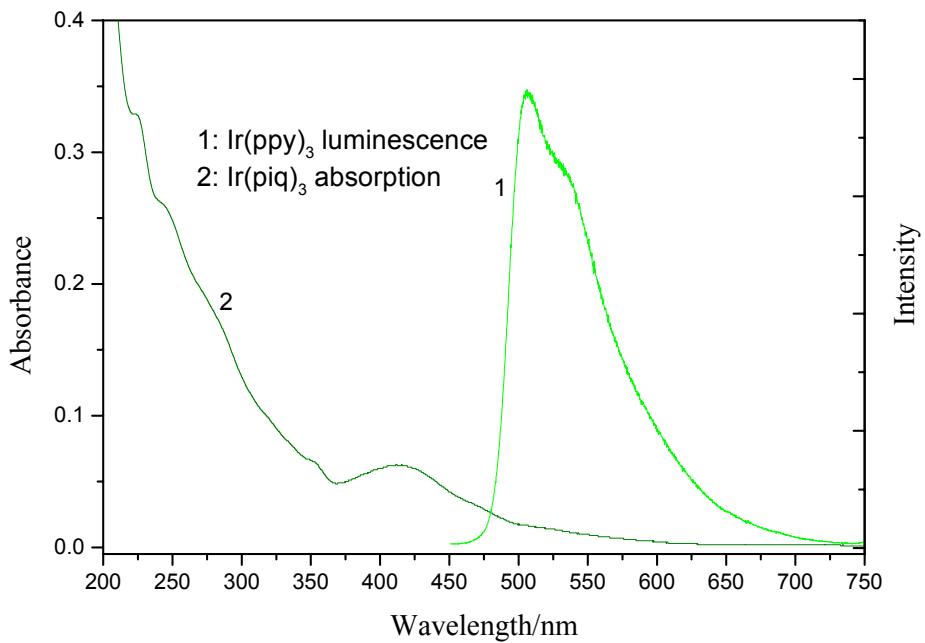

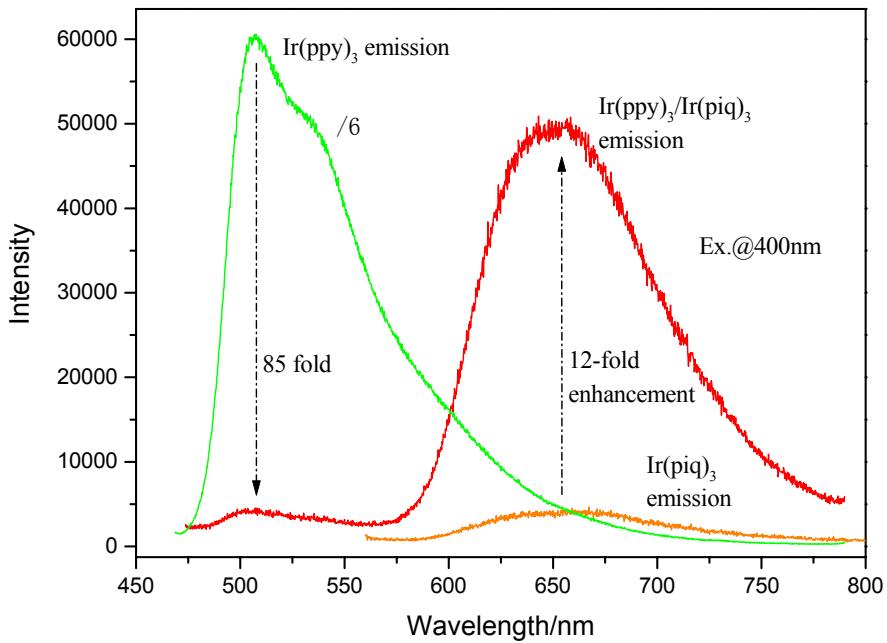

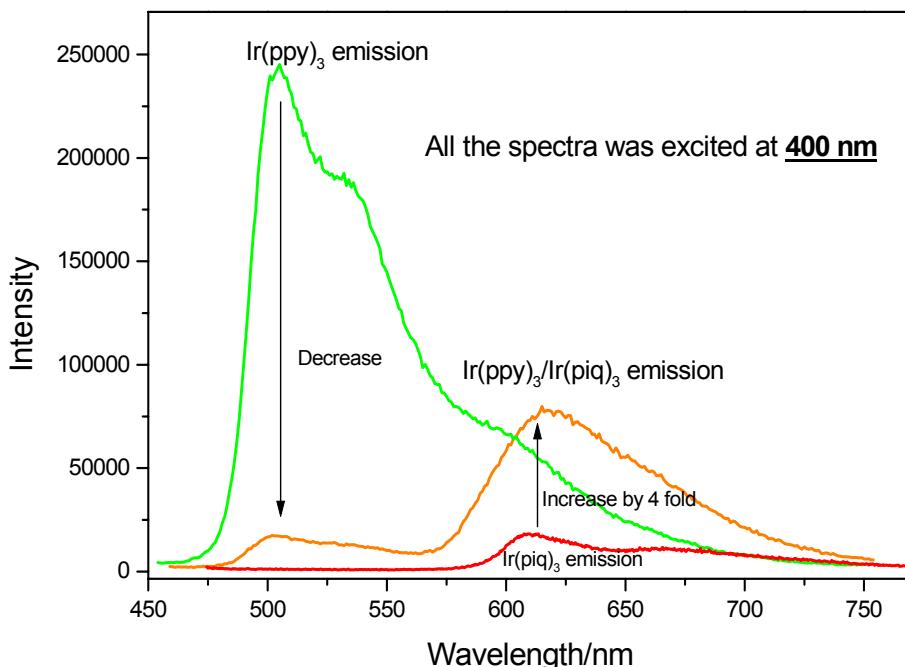

Figure S-3a. The existence of spectral overlap between the optical absorption of $\text{Ir}(\text{piq})_3$ and photoluminescence of $\text{Ir}(\text{ppy})_3$, indicating the possibility of occurrence of resonance energy transfer from $\text{Ir}(\text{ppy})_3$ to $\text{Ir}(\text{piq})_3$.

(1) $\text{Ir}(\text{ppy})_3$, $\text{Ir}(\text{piq})_3$ and their doping system are all solubilized by polyvinyl alcohol (PVA) in water.

(2) Ir(ppy)₃, Ir(piq)₃ and their doping system are all solubilized by cetyltrimethylammonium bromide (CTAB) in water.

Figure S-3b. Enhanced photoluminescence of Ir(piq)₃ by the resonance energy transfer from the energy donor Ir(ppy)₃ in the doping system of Ir(ppy)₃/Ir(piq)₃ solubilized by (1) PVA and (2) CTAB.

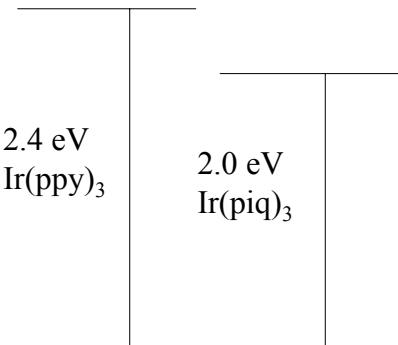

Figure S-4. A triplet energy level diagram has been depicted according to Ref. 19.
