#### **Supporting Information**

### **General methods**

All solvents were distilled using standard methods. CPD was freshly bi-distilled prior to use. All starting materials from commercial suppliers (Aldrich, Fluka, TCI America) were used without further purification. Compounds 1/2 have purity higher than 98 %, as attested by G.C. analysis.

#### **Analytical methods**

The quantitative analyses were performed by either <sup>1</sup>H-NMR (compounds 5/6) or <sup>31</sup>P-NMR (compounds 3/4 and 7/8).

In the case of analyses on phosphorylation reactions, the procedure was as follows: a quantitatively known mixture of 1/2 was left to react with PClPh<sub>2</sub> as described in the experimental section. At the end of the reaction, the mixture was evaporated under reduced pressure at room temperature and the residue was filtered through a funnel with cotton using ethyl acetate in order to remove triethylammonium chloride and other insoluble residues. A known amount of diethylphosphoramidate was added to the mixture as a standard for <sup>31</sup>P-NMR quantifications. After removal of the solvent, NMR analyses were performed (figures 21 and 22).

Similar results were obtained by weighing the compounds after isolation through column chromatography.

Figure 23 represents the <sup>31</sup>P-NMR spectrum obtained from the reaction in which 2.0 eq. of **2**, 1.0 eq. of PClPh<sub>2</sub> and 1.0 eq. of Et<sub>3</sub>N were used.

#### Mass spectra

**Figure 1**. Phosphorylation of adduct **1** with PClPh<sub>2</sub>: Mass spectrum of an ESI analysis of a fraction from column chromatography. Most significant peaks (M+1/M+23): 219.40 – diphenylphosphinic acid; 233.40 – methoxydiphenylphosphine oxide; 354.40/376.20 – adduct **7**; 370.23/392.13 – adduct **3**; 523.20/545.20 – intermediate **11**-*endo*.
