Figure 4 SI. (HS fingerprint plots of the $[\text{Cp}_2\text{Co}^+]$ moiety in compounds **1**, **2**, **3** and **4**. Arrows indicate regions with a predominant contribution from atom pairs involved in intermolecular interactions since only pairs of (d_i , d_e) distances are reported irrespectively of type of atoms involved.)

Figure 4SI shows the HS fingerprint plots of the cobaltocenium ions in compounds **1**, **2**, **3** and **4** while the different contact percentages are reported in Table 4SI. The plots are built by considering the contacts formed by one Cp_2Co unit with the first shell atoms only.

Table 4SI. (Percentage values of contacts formed by the atoms of a $[\text{Cp}_2\text{Co}^+]$ moiety with surrounding atoms in compounds **1**, **2**, **3** and **4**.)

	1a	1b	2	3	4
C···H	10.2	8.2	8.2	7.9	11.8
H···H	25.2	37.8	35.6	34.6	64.9
H···C	13.1	0.7	5.1	4.7	5.5
H···X	48.7	48.9	46.2	47.4	15.7
C···X	2.8	4.5	4.9	5.4	2.1

As compound **1** has two independent cobaltocenium molecules (**1a** and **1b**) in the unit cell, two corresponding 2D histograms are reported. The fingerprint plot **1a** is rather symmetric along the diagonal (where $d_i=d_e$) indicating the same occurrence of (d_i , d_e) and (d_e , d_i) couples (in this case of H···H and C···H contacts, see table 4SI). This reveals the close packing of the molecules in the crystal.¹⁷ The spikes in the bottom-left part indicate that H···F and H···H are the shortest contacts. For the H···F contacts $d_e > d_i$ suggesting the donor nature of the C-H bond involved in HBs with the fluorine. The **1b** 2D plot shows an interesting difference with respect to **1a**: it is not symmetric and presents a predominance of H···H and H···F contacts. This difference indicates that **1b** molecules mainly interact with **1a**.

Compounds **2** and **3** show very similar 2D fingerprint plots which differ from that of **1**. It is relevant that both compounds have only one $[\text{Cp}_2\text{Co}^+]$ moiety in the unit cell and similar trigonal space group, whereas complex **1** has a monoclinic P21/c space group. As for **1a**, the lack of symmetry with respect the diagonal $d_i=d_e$ is due to the different number of C···H and H···C contacts.

The 2D fingerprint plot of complex **4** is clearly different: the histogram is largely dominated by H···H interactions, whereas the number of H···I contacts is one third of the number of H···F in complexes **1**, **2** and **3**.
