Propagation Rate Coefficient and Radical Reactivity Calculations in Penultimate Model

Apart from bootstrap effect, other factors such as solvent polarity, radical-solvent and monomer-solvent complexes are demonstrated to affect the free-radical copolymerization.¹ Thus, when the Mayo-Lewis *copolymer composition* equation (also known as the terminal model) is not sufficient to explain the solvent effects, penultimate unit effects are used to explain the solvent dependence of copolymerization. According to penultimate unit model as originally formulated by Merz *et al.*² and used by Fukuda and co-workers,^{3, 4} the solvent modifies the overall propagation rate coefficient, $\langle k_{(p, \text{cop})} \rangle$, by affecting the reactivity of the radicals and penultimate units, where a propagation rate coefficient, k_{ijk} ($i,j,k = 1$ or 2), refers to the addition of monomer k to polymeric radical j , with i being the penultimate unit. The overall propagation rate coefficient, $\langle k_{(p, \text{cop})} \rangle$, in the penultimate model is:

$$\langle k_{p,\text{cop}} \rangle = \frac{\bar{r}_1 f_1^2 + 2f_1 f_2 + \bar{r}_2 f_2^2}{\left(\frac{\bar{r}_1 f_1}{k_{11}}\right) + \left(\frac{\bar{r}_2 f_2}{k_{22}}\right)} \quad (1)$$

where

$$\bar{k}_{11} = \frac{k_{111}(r_1 f_1 + f_2)}{r_1 f_1 + \frac{f_2}{s_1}} \quad \text{and} \quad \bar{k}_{22} = \frac{k_{222}(r_2 f_2 + f_1)}{r_2 f_2 + \frac{f_1}{s_2}} \quad (2)$$

and the radical reactivity ratios are defined as:

$$s_1 = k_{211}/k_{111} \quad \text{and} \quad s_2 = k_{122}/k_{222} \quad (3)$$

According to the penultimate unit model, the solvent effect on copolymerization may be *explicit* or *implicit*. If the solvent modifies both copolymer composition and propagation rate coefficient, it is known as an *explicit* solvent effect; whereas, if solvent only influences the propagation rate coefficient without changing the copolymer composition (the situation when $\bar{r}_1 = r_1$ and $\bar{r}_2 = r_2$), then it is named as an *implicit* solvent effect following the original terminology used by Fukuda and co-workers.⁴ For instance, in the case of styrene/methyl methacrylate (ST/MMA) system in benzyl alcohol, it is found that the modifications in the

monomer reactivity ratios in solvent are minor, so, the copolymer composition is unchanged, but solvent induces an implicit solvent effect in the propagation rate coefficient.⁵

For example, it is now very well demonstrated that polar solvents significantly affect the copolymerization reactions of donor-acceptor type copolymers through stabilization of their charge-transfer type transition state. The solvent can also affect the reaction through complex formation either with the propagating radical or the monomer.¹ H-bonding interactions are shown to significantly modify the copolymerization kinetics. For instance, the observed solvent dependence of the propagation rate coefficient for ST/HEMA system in alcohols is explained by an implicit penultimate unit effect specific to H-bonding.⁶
