7 **Fig. S2** Serum stability of **CLD/siMek1** lipoplexes. Samples of siRNA in aqueous solution were mixed in a
8 1:1 ratio with fresh serum to give 50% serum concentration and incubated at 37 °C for 24 h. After 24 h,
9 each sample was loaded on a 1% agarose gel as described above and the electrophoresis was performed to
10 visualize the siRNA. The lane numbers correspond to different cationic lipid/**siMek1** N/P ratios: 1.
11 0:1(**siMek1** only), 2. 4:1, 3. 6:1, 4. 8:1, 5. 10:1, 6. 12:1. Each lane contains 1.33 µg **siMek1**. The **siMek1**
12 was visualized with Goldenview™ dye staining. The brightness band indicated the free **siMek1**.

Fig. S3 DTT decomplexation assay of **CLD/siMek1** complexes. Lipoplexes of **CLD/siMek1** were prepared to ensure complete binding of **siMek1** by **CLD** liposomes at N/P = 12, and then incubated with 0, 10, 20, 50, 100, 200, 300 mM of DTT in RNase free water at 37 temperature for 40 min. The samples were analyzed on a 1% agarose gel as described above. Results were presented as the average of three independent experiments at least

6 **Fig. S4** *In vitro* siMek1 uptake study by High Content Screening (HCS) reader. A375 cells were incubated
7 with liposomes entrapping FAM-siMek1 for 5 h at 37 °C. The final concentration of FAM-siMek1 was 50
8 nM. After washing with PBS, the cells were fixed with 4% PFA. Cells were then incubated with DAPI for
9 nuclear staining. The fluorescence of the cells was visualized with HCS. Row a: the merge images of
10 DAPI and FAM-siMek1; Row b: the images of DAPI in the cell nuclei; Row c: the images of DAPI in the
11 cytoplasm.
