1: FT-IR spectrum of the as-prepared PPy-MP film.

In the FT-IR spectrum, the absorption band at 1527.4 cm^{-1} is assigned to the pyrrole ring, *e. g.* the combination of C=C and C-C stretching vibration. The band at 1404 cm^{-1} is associated with C-N stretching vibration. C-H deformation vibrations is showed at bands 1047.2 cm^{-1} . The bands 1173 cm^{-1} and 902 cm^{-1} are assigned to the stretching vibration of oxidized PPy. In addition, the strong absorption at 3419 cm^{-1} and weak absorption at 2939 cm^{-1} , assigned as N-H and C-H stretching, respectively. Accordingly, all characteristic bands of PPy were observed, which showed identical doped PPy.¹

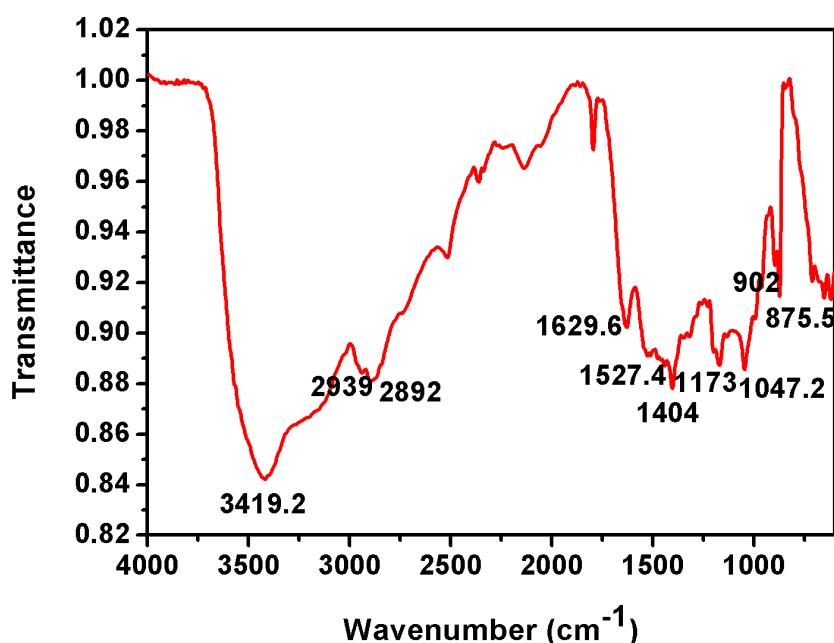

Fig S1 FT-IR spectrum of as-prepared PPy-MP film, confirming the typical PPy molecular structure.

2. The high-magnified SEM image of the as-prepared PPy-MP taken in different area. PPy-MP were clothed by PPy homogeneously and oriented mostly in a long-axis direct.

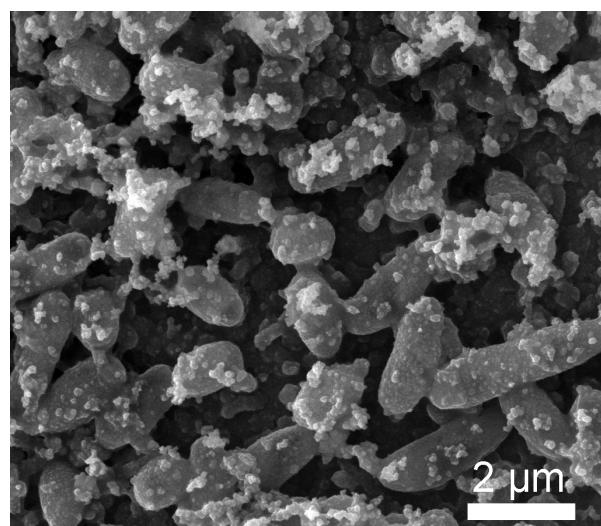

Fig. S2 The high-magnified SEM image of the as-prepared PPy-MP.

3: The water contact angle measurement on the as-prepared PPy-MP film and the cauliflower-like PPy film in air, respectively, exhibiting superhydrophilicity in air

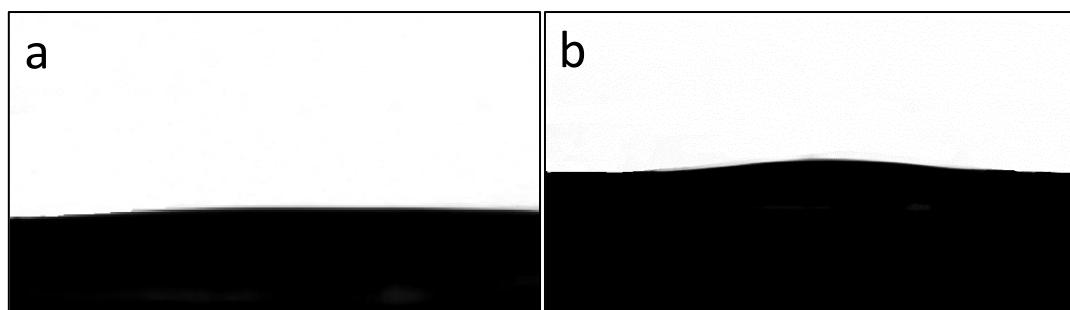

Fig. S3 The shape of a water drop on (a) PPy-MP film and (b) cauliflower-like PPy film both exhibit superhydophilic property in air ($CA \approx 0^\circ$).

4: XPS Cl_{2p} spectrum of as-prepared PPy-MP.

The X-ray photoelectron spectroscopy (XPS) spectrum of PPy-MP was conducted on a VG ESCALAB 220i-XL instrument with a mono-chromatic Al Ka X-ray source. It's clearly proved in Fig. S4 that PPy was doped by Cl⁻.

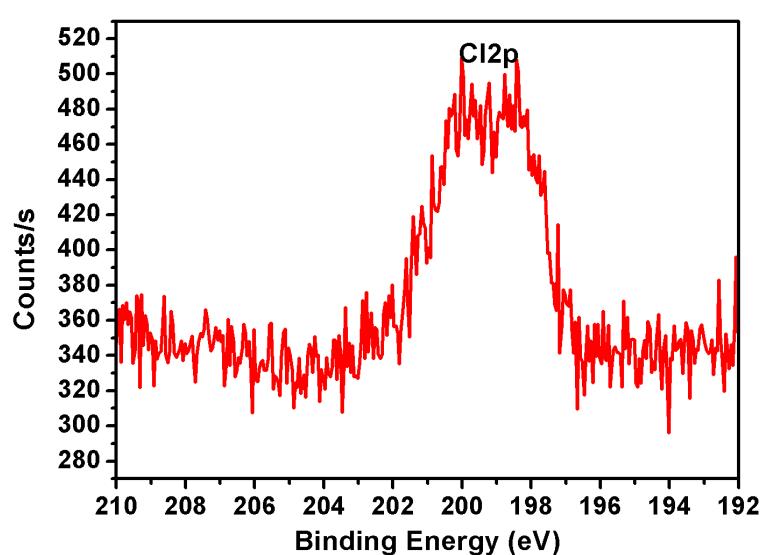

Fig. S4 XPS Cl_{2p} spectrum of as-prepared PPy-MP.
