ORR reactions (Eq. 1–3: multistep two-electron pathway; Eq. 4: one-step direct four-electron pathway)

Calculation of electron transfer number (n)

RDE plots (J^{-1} vs. $\omega^{-1/2}$), were analyzed according to the Koutecky–Levich (**K–L**) equation expressed as **Eq. 5** to assess the apparent number of electrons transferred during ORR (n) at various potentials.^[1-3]

$$\frac{1}{|J|} = \frac{1}{|J_L|} + \frac{1}{|J_K|} = \frac{1}{B\sqrt{\omega}} + \frac{1}{|J_K|} \quad (5)$$

$$B = 0.2nFC_0(D_0)^{2/3}\nu^{-1/6}$$

In the Koutecky–Levich equation, J , J_L , J_K are the measured current density, the diffusion-limiting current density, and the kinetic-limiting current density, respectively; ω is the rotation speed in rpm, F is the Faraday constant (96,485 C mol⁻¹), D_0 is the diffusion coefficient of oxygen in 0.1 M KOH (1.9×10^{-5} cm² s⁻¹), ν is the kinetic viscosity (0.01 cm² s⁻¹), and C_0 is the bulk concentration of oxygen (1.2×10^{-6} mol cm⁻³). 0.2 is a constant when the rotation speed is expressed in rpm. The n can be extracted from the slope of the K–L plot.

The transferred electron number per oxygen molecule (n) during ORR can be also calculated from **Eq. 6** based on RRDE measurements,^[4-5]

$$n = \frac{4I_D}{I_D + \frac{I_R}{N}} \quad (6)$$

and the H₂O selectivity can be analyzed from the following equation:

$$\text{Selectivity}_{H_2O} = \frac{I_D - \frac{I_R}{N}}{I_D + \frac{I_R}{N}} \times 100 = \frac{n-2}{2} \times 100 \quad (7)$$

where I_D , I_R , and $N = 0.30$ are the disk current, ring current, and collection efficiency of Pt ring obtained by using the one-electron Fe(CN)₆^{3-/4-} redox couple, according to the manufacture's instruction, respectively.

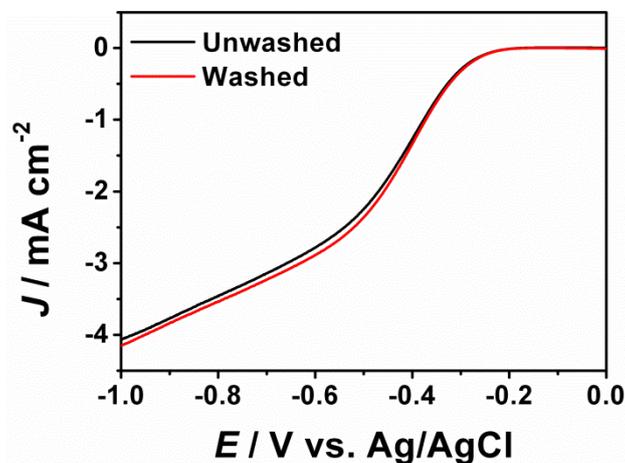

Fig. S21 Polarization curves of NGPC-800-5 with or without acid wash treatment. The results are obtained at conditions of 1600 rpm in an O_2 -saturated 0.1 M KOH *aq.* solution at R.T., and a sweep rate of 5 mV s^{-1} .

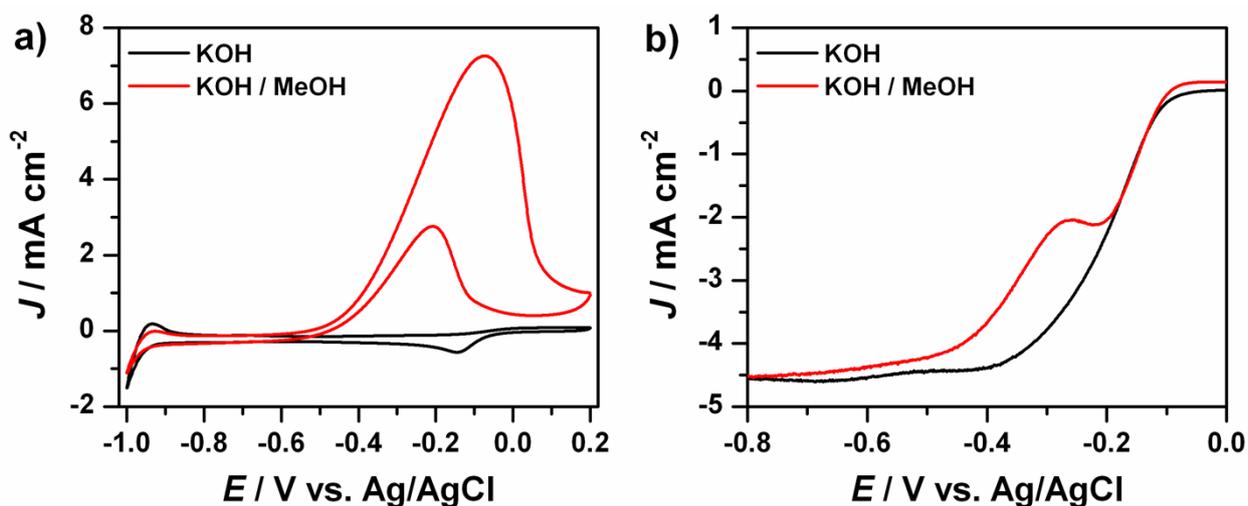

Fig. S22 a) CV and b) LSV curves of commercial Pt/C in O_2 -saturated 0.1 M KOH solution with or without the addition of 3 M MeOH. The RDE measurements were carried out with a sweep rate of 5 mV s^{-1} , 1600 rpm.

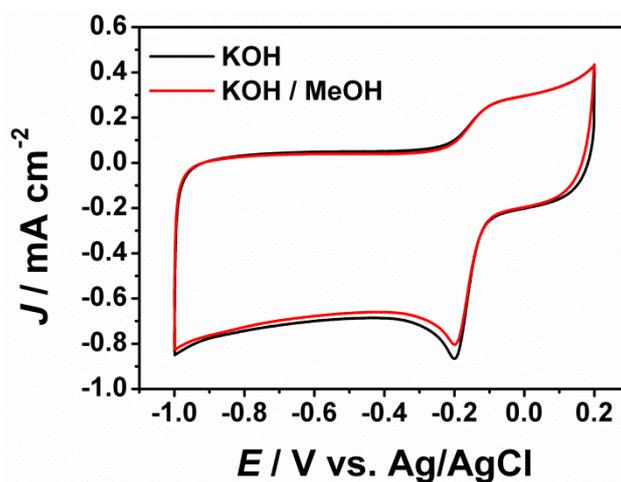

Fig. S23 CV curves of NGPC-1000-10 in O_2 -saturated 0.1 M KOH solution at a scan rate of 10 mV s^{-1} , with or without the addition of 3 M methanol.

Table S2 Summary of ORR performance for some other nitrogen-doped metal-free catalysts and MOF-derived non-precious metal electrocatalysts (M/N/C) reported recently.

Heteroatom-doped carbon materials ^a	Synthetic methods (reaction precursors)	ORR performance vs. Pt/C ^b	Electron transfer number	Refs.
NGPC-1000-10	Nanocasting of ZIF-8 nanocrystals	35 mV more negative in E_{onsets} , comparable J_L of 4.67 mA cm^{-2} and J_K of 14.18 mA cm^{-2} at -0.35 V .	3.80–3.89 at range of -0.25 to -0.6 V	Present work
POF-C-1000	Nanocasting of PAF-6 and furfuryl alcohol	40 mV more negative in E_{onsets} , 0.8 and 55 mA cm^{-2} less in J_L and J_K at -0.60 and -0.44 V vs. Hg/HgO	3.75 at -0.44 V vs. Hg/HgO	1
NCNFs	Carbonization of electrospun polyacrylonitrile nanofiber films	45 mV more negative in E_{onsets} , <i>ca.</i> 1.0 mA cm^{-2} less in J_L	3.6–4.0 at range of -0.35 to -0.50 V	2
PN-ACNT	CVD with ferrocene,	80 mV more negative in E_{onsets} ,	3.67–3.88	3

	pyridine and triphenylphosphine	higher cathodic current density below <i>ca.</i> -0.25 V vs.SCE	at -0.3 to -0.6 V vs.SCE	
N-S-G	Melamine, benzyl disulfide, graphene oxide with SiO ₂ as template	30 mV more negative in E_{onset} , comparable J_L and nearly twice higher in J_K at -0.80 V	3.3–3.6	4
NCNTs(BTA)	Carbonization of MWCNTs with Triazole and tetrazole derivatives	80 mV more negative in E_{onset} , comparable J_L at -0.9 V vs.SCE and 1.0 mA cm ⁻² higher in J_K at -0.5 V vs.SCE	3.62 at -0.5 V vs.SCE	5
N-HCNPs	CVD with trinitrophenol under high temperature and pressure	90 mV more negative in E_{onset} , comparable J_L at 1500 rpm and J_K at potential range of -0.3 to -0.4 V	3.70 at -0.4 V	6
CA-TCA_900	Hydrothermal carbonization with glucose/TCA	210 mV more negative in E_{onset} , comparable J_L at 1600 rpm	<i>ca.</i> 2.6–3.7 at range of -0.4 to -1.0 V	7
NG-1000	Direct annealing of graphene oxide/PDA	70 mV more negative in E_{onset} , comparable J_L at 1600 rpm and J_K at potential of -0.5 V vs. SCE	3.89 at -0.5 V vs. SCE	8
Acr@MW	Hydrothermally functionization of MWCNTs with aniline derivatives	38 mV more negative in E_{onset} , comparable J_L at 800 rpm	3.2 at -1.0 V	9
POMC-3	Nanocasting of SBA-15/triphenylphosphine	50 mV more negative in E_{onset} , comparable J_L at 1600 rpm	3.91 at -0.25 V	10
NG-NCNT	Hydrothermal treatment with Graphene oxide/oxidized MWCNTs/ammonia	70 mV more negative in E_{onset} , comparable J_L at 1600 rpm	3.3–3.7 at range of -0.4 to -0.7 V vs. SCE	11
NCNTs-20	Direct carbonization of Zn-Fe-ZIF/dicyandiamide	7 mV more positive in $E_{1/2}$, <i>ca.</i> 0.7 mA cm ⁻² higher in J_L at 1600 rpm	Not mentioned	12

^a The samples listed in the table are the most efficient one chosen out from those reported in the corresponding literatures, respectively.

^b All potentials are referred as Ag/AgCl scale, unless otherwise stated.

For comparison, all samples are tested in 0.1 M KOH solution under room temperature, unless otherwise stated.

The limiting current densities (J_L) are compared at a rotation speed of 1600 rpm, unless otherwise stated.
