### 1. Thermal atomic layer deposition (ALD) of ZnO and Al<sub>2</sub>O<sub>3</sub> onto G-aerogel

ZnO film was deposited onto G-aerogel by using an ALD system of SUNALE R200 (Picosun). Typically, a piece of G-aerogel was placed in the ALD chamber where zinc diethyl ( $\text{Zn}(\text{C}_2\text{H}_5)_2$ , 99.9999%, Jiangsu Nata Opto-electronic Material Co. Ltd) reacted with H<sub>2</sub>O to form ZnO for 60 ALD cycles. Then, trimethyaluminium ( $\text{Al}(\text{CH}_3)_3$ , 99.9999%, Jiangsu Nata Opto-electronic Material Co. Ltd) reacted with H<sub>2</sub>O to form Al<sub>2</sub>O<sub>3</sub> via “ $x$ ” ALD cycles,  $x=0, 4, 10$  or  $20$ , respectively. The operational pressure of the ALD system was maintained at about 1800-2000 Pa throughout the deposition. Vapors of the two precursors for forming each oxide were alternately carried by N<sub>2</sub> gas into the reaction chamber and the temperature was kept at 150°C. The as-obtained ZnO-G- $x$  ( $x$  refers to the number of ALD cycles used for depositing Al<sub>2</sub>O<sub>3</sub>) samples were treated by heating at 100°C under vacuum for 12 h before characterizations.

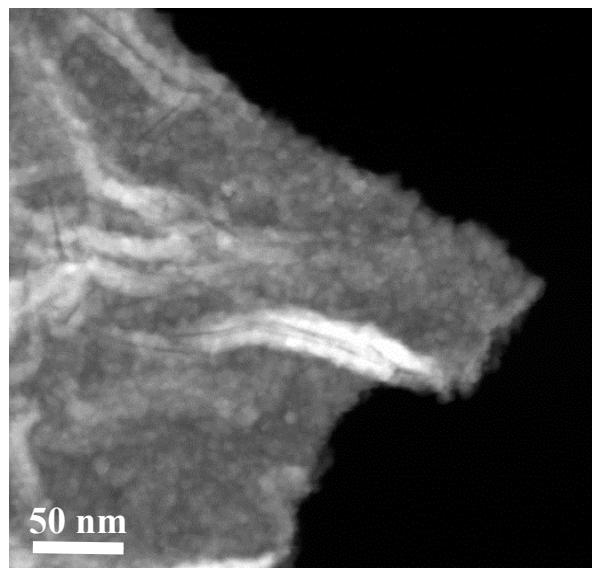

## 2. Supplementary figures

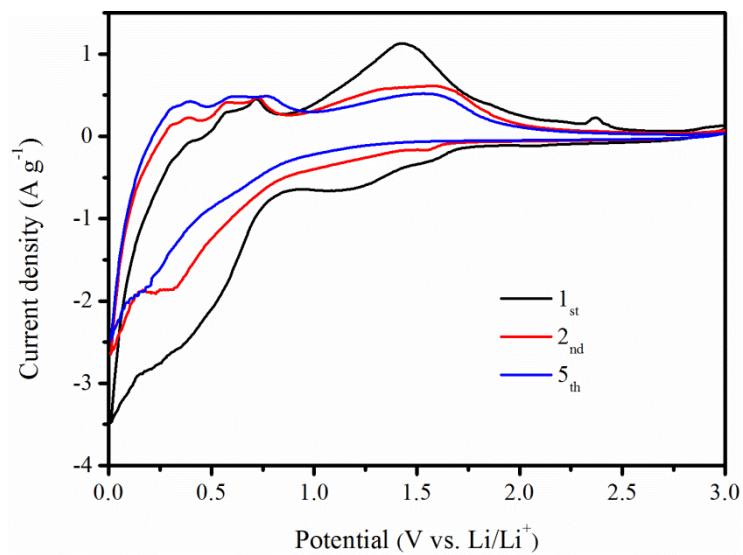

**Fig. S1** STEM image of ZnO-G-0 composite.

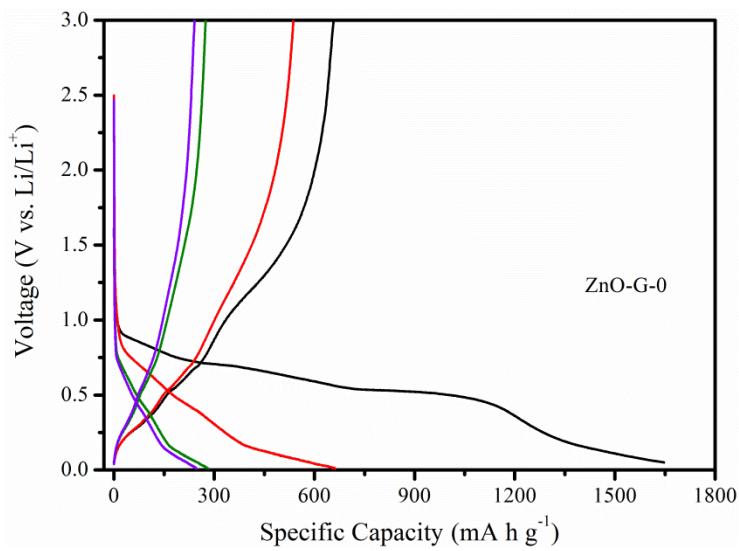

**Fig. S2** STEM image of ZnO-G-5 composite.

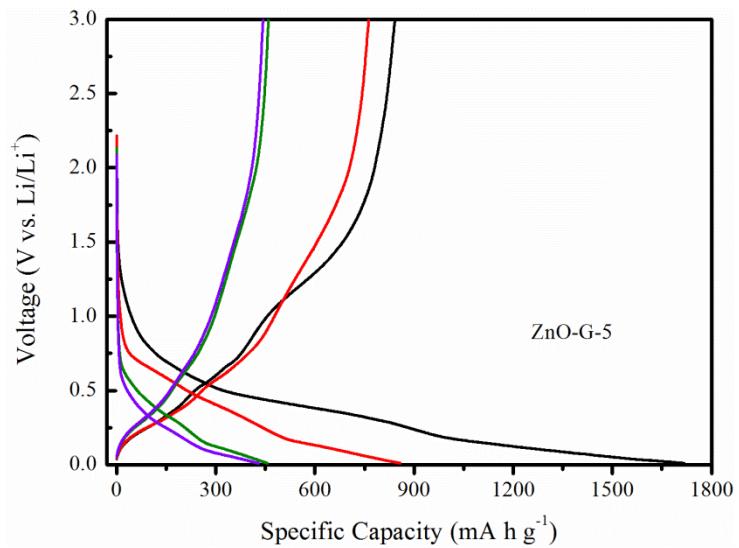

**Fig. S3** STEM image of ZnO-G-20 composite.

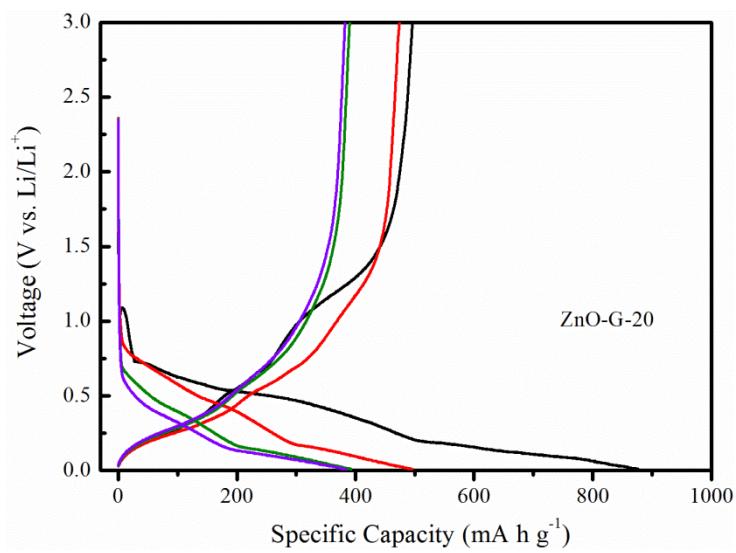

**Fig. S4** CV curves of ZnO-G-0 composite at 0.1 mV s<sup>-1</sup>.

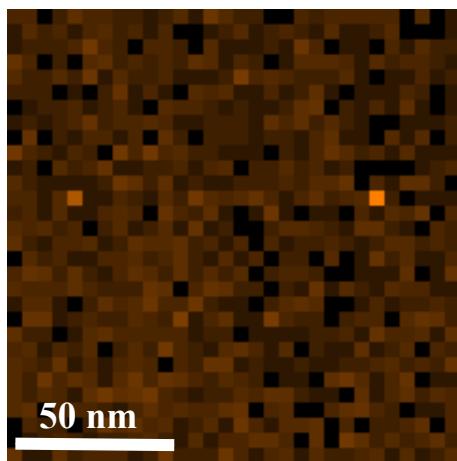

**Fig. S5** Galvanostatic charge/discharge curves of ZnO-G-0 composite at a current density of 100 mA g<sup>-1</sup>.

**Fig. S6** Galvanostatic charge/discharge curves of ZnO-G-5 composite at a current density of 100 mA g<sup>-1</sup>.

**Fig. S7** Galvanostatic charge/discharge curves of ZnO-G-20 composite at a current density of 100 mA g<sup>-1</sup>.

**Fig. S8** EDS mapping of Al element in ZnO-G-10 composites after 100 cycles of charging/discharging at 100 mA g<sup>-1</sup>.

**Table S1** Comparison of the electrochemical performances of different ZnO anode materials  
(1 C= 978 mA g<sup>-1</sup>, C<sub>dis</sub>=discharge capacity, C<sub>char</sub>=charge capacity, C<sub>rev</sub>= Reversible capacity).

ZnO anode material	1 <sup>st</sup> C <sub>dis</sub> (mA h g <sup>-1</sup> )	1 <sup>st</sup> C <sub>char</sub> (mA h g <sup>-1</sup> )	C <sub>rev</sub> (mA h g <sup>-1</sup> )	Ref
ZnO/graphene	1235	420	300, 25 cycles at 50 mA g <sup>-1</sup>	[1]
Nanosized ZnO/Carbon	1550	900	700 after 100 cycles at 100 mA g <sup>-1</sup> (based on ZnO)	[2]
ZnO nanorod/Carbon	1150	640	330, 50 cycles at 0.25 C	[3]
ZnO nanorod arrays	1461	980	310, 40 cycles at 0.1 mA cm <sup>-2</sup>	[4]
ZnO films	900	400	220, 40 cycles at 20 μA cm <sup>-2</sup>	[5]
ZnO/Ni	1048	786	490, 30 cycles at 80 mA g <sup>-1</sup>	[6]
ZnO-C microsphere	1432	798	520, 150 cycles at 100 mA g <sup>-1</sup>	[7]
ZnO nanotube	932	621	386, 50 cycles at 0.5 C	[8]
ZnO nanosheets	1120	750	400, 100 cycles at 0.5 mA g <sup>-1</sup>	[9]
ZnO/Se	703	505	400, 100 cycles at 5 μA cm <sup>-2</sup>	[10]
ZnO/Au	1280	660	392, 50 cycles at 120 mA g <sup>-1</sup>	[11]
ZnO/NiO/C	1235	805	488, 50 cycles at 0.5 C	[12]
ZnO nangrains/graphene/Al <sub>2</sub> O <sub>3</sub>	1513	803	490, 100 cycles at 100 mA g <sup>-1</sup>	This work
