## Monomeric and dendritic ethacrynic acid derivatives

The syntheses were carried out using standard high vacuum and dry-argon techniques. All chemicals were purchased from Acros, Aldrich, Fluka, and used without further purification. The solvents were freshly dried and distilled according to standard procedures prior to use.

<sup>1</sup>H, <sup>13</sup>C, and <sup>31</sup>P NMR spectra were recorded with Bruker AV300, DPX300, AV400, spectrometers. All <sup>13</sup>C NMR and <sup>31</sup>P NMR spectra were generally recorded decoupled {<sup>1</sup>H}. Fourier transformed infrared (FTIR) spectra were obtained with a Perkin–Elmer Spectrum 100 FT-IR spectrometer on neat samples (ATR FT-IR) or in solutions. Mass spectrometry was carried out with a Thermo Fisher DS QII (DCI/NH<sub>3</sub> or DCI/CH<sub>4</sub>).

**Procedure:** To a mixture of tyramine (136 mg, 1 mmol) and ethacrynic acid (300 mg, 1 mmol) in dry DMF (8 mL) were added at room temperature EDCI (230 mg, 1.2 mmol) and a catalytic amount of DMAP. The reaction mixture was stirred overnight at room temperature. Ethyl acetate (150 mL) was added and the organic layer was washed with water (2 × 50 mL) and brine (3 × 50 mL), dried over anhydrous MgSO<sub>4</sub> and then concentrated under reduced pressure. The crude product was purified by flash chromatography (DCM/EtOAc 90:10 to 80:20) to give the desired compound **13** as a white powder.

## Synthesis of 15, 16 and 17.

## General procedure

A dendrimer **Gn** (100 mg, 0.055 mmol, n=1), (100 mg, 0.021 mmol, n=2) or (100 mg, 0.01 mmol, n=3), was dissolved in THF (20 ml), and then appropriate masses of phenol **14** (321 mg, 0.693 mmol, n=1), (245 mg, 0.53 mmol, n=2) or (218 mg, 0.47 mmol, n=3), and cesium carbonate (430 mg, 1.32 mmol, n=1), (328 mg, 1.01mmol, n=2), (312 mg, 0.96 mmol, n=3), were added. The reaction mixture was stirred overnight at room temperature, and then centrifuged. The solution was concentrated and precipitated two times in pentane/  $Et_2O$  (9/1). The product was filtered and dried under vacuum to give **15** (generation 1), **16** (generation 2) or **17** (generation3) as white powders.

### Synthesis of 18 and 19.

**Procedure:** To a solution of **13** (200 mg, 0.47 mmol) or **14** (205 mg, 0.47 mmol), in dry DCM (10 mL) were added triethylamine (109  $\mu$ L, 79 mg, 0.78 mmol) and POCl<sub>3</sub> (12  $\mu$ L, 20 mg, 0.14 mmol). The reaction mixture was stirred overnight at room temperature and concentrated under reduced pressure. The crude product was purified by flash chromatography (DCM/THF 90:10 to 80:20) to give **18** or **19** as white powders.

### Synthesis of 20.

**Procedure:** To a solution of **13** (200 mg, 0.47 mmol), in dry DCM (10 mL) were added triethylamine (109  $\mu$ L, 79 mg, 0.78 mmol) and PSCl<sub>3</sub> (15  $\mu$ L, 25 mg, 0.15 mmol). The reaction mixture was stirred overnight at room temperature and concentrated under reduced pressure. The crude product was purified by flash chromatography (DCM/EtOAc 62:40) to give **20** as a white powder.

*Cell culture and proliferation assay.* The human cell line KB (nasopharyngeal epidermis carcinoma) was originated from the NCI. Cells were grown in D-MEM medium supplemented with 10% fetal calf serum, in the presence of penicillin, streptomycin and fungizone in 75 cm<sup>2</sup> flask under 5% CO<sub>2</sub>. HL60 (promyelocytic leukemia) and EPC (carp epithelium) cells from ATCC were grown in complete RPMI-1640 medium. Cells were plated in 96-well tissue culture with dendrimers dissolved in DMSO (1% final volume). After 72 h exposure, MTS reagent (Promega) was added and incubated for 3 h at 37°C: the absorbance was monitored at 490 nm and results are expressed as the inhibition of cell proliferation calculated as the ratio [(1-(OD490 treated/OD490 control))×100]. For IC<sub>50</sub> determinations (50% inhibition of cell proliferation) experiments were performed in duplicate.
