Experimental procedures and spectral characterization for **3d**, **4a-d**, **5d**.

**General methods.** <sup>1</sup>H NMR: *Bruker* AC 250 (250 MHz), *Bruker* AM 400 (400 MHz);  $\delta$  = 7.26 ppm for CDCl<sub>3</sub>. The description of signals include: s = singlet, d = doublet, m = multiplet, dd = doublet of doublet. The spectra were analyzed according to first order. All coupling constants (*J*) are absolute values. The signal abbreviations include: Ar-H = aromatic proton. <sup>13</sup>C-NMR: *Bruker* AM 400 (400 MHz);  $\delta$  = 77.00 ppm for CDCl<sub>3</sub>. The signal structure was analyzed by DEPT and is described as follows: + = primary or tertiary C-atom (positive signal = secondary C-atom (negative signal and q =quaternary C-atom (no signal) MS (EI) (electron impact mass spectrometry): *Finnigan* MAT 90 (70 eV). The molecular fragments are quoted as the relation between mass and charge (m/z), the intensities as a percentage value relative to the intensity of the base signal (100%). The molecular ion obtains the abbreviation [M<sup>+</sup>]. IR (infrared spectroscopy): FT-IR *Bruker* IFS 88. IR spectra of solids were recorded in KBr. The deposit of the absorption band was given in wave numbers  $\tilde{\nu}$  in cm<sup>-1</sup>. The forms and intensities of the bands were characterized as follows: vs = very strong 0-10% T, s = strong 10-40% T, m = medium 40-70% T, w = weak 70-90% T, vw = very weak, 90-100% T, br = broad. Elemental analysis: *Haraeus* CHN-O-Rapid. Descriptions without nominated temperature were done at room temperature (rt), whereas there were used the following abbreviations: calc. (theoretical value), found (measured value). Information is given in mass percent. – TLC (Thin layer chromatography): Silica gel coated aluminum plates (*Merck*, silica gel 60, F254), detected under UV-light at 254 nm. Solvent mixtures are understood as volume/volume. Solid materials were powdered. Solvents, reagents and chemicals were purchased from Aldrich, Fluka, Janssen, and Merck. Ethyl acetate, diethyl ether and dichloromethane were distilled prior to use. All other solvents, reagents and chemicals were used as purchased.
