<sup>[a]</sup> The  $^3J_{\text{HH}}$  and  $^3J_{\text{HF}}$  values were obtained from the simulated  $^1\text{H}$  NMR spectrum (Figure S1). The  $^3J_{\text{FF}}$  values were not determined (N/D) because the  $^{19}\text{F}$  NMR and  $^{19}\text{F}\{^1\text{H dec}\}$  NMR spectra (Figures S3 and S4) were not amenable to simulation due to poor peak shape and resolution.

Figure S8. Variable-temperature  $^{19}\text{F}$   $\{^1\text{H dec}\}$  NMR (470 MHz, 80:20 v/v  $\text{CDCl}_3/\text{D}_8\text{-THF}$ ) of **1a**

Figure S9. <sup>[a]</sup> <sup>1</sup>H NMR (400 MHz, 76:24 v/v CDCl<sub>3</sub>/THF) of **1b**

<sup>[a]</sup> This spectrum was obtained after performing the reaction in tetrahydrofuran rather than D<sub>8</sub>-tetrahydrofuran, hence the large solvent peaks. A subsequent repetition of the reaction using D<sub>8</sub>-tetrahydrofuran as the solvent provided the <sup>19</sup>F NMR spectra below (Figures S10 and S11), but the <sup>1</sup>H NMR spectrum from the reaction in D<sub>8</sub>-tetrahydrofuran contained a masking impurity in the fluoroalkyl region.

<b>9</b>									24.5

<sup>[a]</sup> Coupling constants were determined by a five-step process:

1. Inspection of the <sup>19</sup>F {<sup>1</sup>H dec} NMR spectrum (Figure S19) provided all <sup>3</sup>J<sub>FF</sub>, <sup>4</sup>J<sub>FF</sub> and <sup>5</sup>J<sub>FF</sub> values, which allowed all fluorine signals (**3**, **5**, **7** and **9**) to be assigned;
2. The <sup>19</sup>F NMR spectrum (Figure S18) was then simulated, giving all <sup>3</sup>J<sub>HF</sub> values;
3. Inspection of the <sup>1</sup>H,<sup>1</sup>H 2D-COSY NMR spectrum (Figure S17) allowed signals corresponding to the “outside CHF protons” (**2** and **8**, δ ~ 4.4 ppm) to be distinguished from the “inside CHF protons” (**4** and **6**, δ ~ 4.1 ppm);
4. Inspection of the “inside CHF protons” region of the <sup>1</sup>H NMR spectrum (Figure S16) revealed that one multiplet (δ 4.19 ppm) contained a coupling constant of 9.1 Hz, while the other (δ 4.24 ppm) contained a coupling constant of 16.7 Hz; these values were cross-checked against the <sup>3</sup>J<sub>HF</sub> values from the simulated <sup>19</sup>F NMR spectrum (Figure S18), which allowed protons **4** and **6** to be unambiguously assigned to their respective signals;
5. Further inspection of the multiplets corresponding to protons **4** and **6** in the <sup>1</sup>H NMR spectrum (Figure S16) revealed the <sup>3</sup>J<sub>HH</sub> values between protons (**2** and **4**), (**4** and **6**), and (**6** and **8**).

This five-step process provided a complete “map” of <sup>3</sup>J<sub>HF</sub> and <sup>3</sup>J<sub>HH</sub> values. It should be emphasised that there remains an ambiguity because this “map” of *J* values suggests a symmetrical pattern of *gauche* and *anti* H-C-C-F and H-C-C-H angles, and the “map” of *J* values could fit the molecule in either of two orientations (see structures above). Nevertheless, both orientations of the “map” of *J* values suggest the same molecular conformation.
