## Experimental

## General Experimental

Reactions involving moisture-sensitive reagents were carried out under a nitrogen or argon atmosphere using standard vacuum line techniques and glassware that was flame dried and cooled under nitrogen before use. Solvents were dried according to the procedure outlined by Grubbs and co-workers. ${ }^{1}$ Water was purified by an Elix ${ }^{\circledR}$ UV-10 system. All other solvents were used as supplied (analytical or HPLC grade) without prior purification. Organic layers were dried over $\mathrm{MgSO}_{4}$. Thin layer chromatography was performed on aluminium plates coated with $60 \mathrm{~F}_{254}$ silica. Plates were visualised using UV light ( 254 nm ), iodine, $1 \%$ aq $\mathrm{KMnO}_{4}$, or $10 \%$ ethanolic phosphomolybdic acid. Flash column chromatography was performed either on Kieselgel 60 silica on a glass column, or on a Biotage SP4 automated flash column chromatography platform.

Melting points were recorded on a Gallenkamp Hot Stage apparatus and are uncorrected. IR spectra were recorded on a Bruker Tensor 27 FT-IR spectrometer as either a thin film on NaCl plates (film) or a KBr disc ( KBr ), as stated. Selected characteristic peaks are reported in $\mathrm{cm}^{-1}$. NMR spectra were recorded on Bruker Avance spectrometers in the deuterated solvent stated. The field was locked by external referencing to the relevant deuteron resonance. Low-resolution mass spectra were recorded on either a VG MassLab 20-250 or a Micromass Platform 1 spectrometer. Accurate mass measurements were run on either a Bruker MicroTOF internally calibrated with polyalanine, or a Micromass GCT instrument fitted with a Scientific Glass Instruments BPX5 column ( $15 \mathrm{~m} \times 0.25 \mathrm{~mm}$ ) using amyl acetate as a lock mass.

## X-ray Crystal Structure Determination for 14

Data were collected using an Enraf-Nonius k-CCD diffractometer with graphite monochromated Mo-K $\alpha$ radiation using standard procedures at 150 K . The structure was solved by direct methods (SIR92), all nonhydrogen atoms were refined with anisotropic thermal parameters. Hydrogen atoms were added at idealised positions. The structure was refined using CRYSTALS. ${ }^{2}$

X-ray crystal structure data for $\mathbf{1 4}\left[\mathrm{C}_{20} \mathrm{H}_{25} \mathrm{NO}_{2}\right]: \mathrm{M}=311.42$, monoclinic, space group $P 12 / a l$, $a=$ $10.83920(10) \AA, b=28.0222(3) \AA, c=12.21180(10) \AA, \beta=110.5571(5)^{\circ}, V=3473.00(6) \AA^{3}, \mathrm{Z}=8, \mu=$ $0.76 \mathrm{~mm}^{-1}$, colourless plate, crystal dimensions $=0.1 \times 0.3 \times 0.4 \mathrm{~mm}^{3}$. A total of 7908 unique reflections were measured for $5<\theta<27$ and 4662 reflections were used in the refinement. The final parameters were $w R_{2}=0.042$ and $R_{1}=0.040[I>3.0 \sigma(I)]$.

The reaction mixture was allowed to cool to rt and concentrated in vacuo. $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$ was added and mixture was extracted with $\mathrm{DCM}(3 \times 20 \mathrm{~mL})$. The combined organic extracts were dried and concentrated in vacuo. The residue was dissolved in MeOH $(10 \mathrm{~mL})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(100 \mathrm{mg})$ were added. The resultant suspension was stirred for 16 h at rt before being concentrated in vacuo. $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$ was added and mixture was extracted with $\mathrm{DCM}(3 \times 20 \mathrm{~mL})$. The combined organic extracts were washed sequentially with $\mathrm{H}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$ and brine ( 50 mL ), dried, and concentrated in vacuo to give $\mathbf{1 4}$ as a white solid ( $130 \mathrm{mg}, 57 \%,>98 \%$ de).
