We describe the approach for labeling pseudouridine and generate fully ${ }^{15} \mathrm{~N}$-enriched, [ $\left.1,3-{ }^{15} \mathrm{~N}\right]$-pseudouridine from relatively inexpensive starting materials. Our synthetic strategy involves coupling a pyrimidine precursor, 5-iodo-2,4-dimethoxy-[1,3- $\left.{ }^{15} \mathrm{~N}\right]$ pyrimidine, to a protected D-ribono-1,4-lactone, followed by reduction to generate $\beta$ [ $\left.1,3-{ }^{15} \mathrm{~N}\right]$-pseudouridine. ${ }^{1}$
$\left[{ }^{15} \mathrm{~N}\right]$-uracil was generated from relatively inexpensive $\left[{ }^{15} \mathrm{~N}\right]$-urea according to a literature procedure. ${ }^{2}\left[{ }^{15} \mathrm{~N}\right]$-uracil reacted with phosphorus oxychloride and $\mathrm{N}, \mathrm{N}$ dimethylaniline. ${ }^{3}$ The crude 2,4-dichloro-[1,3- $\left.{ }^{15} \mathrm{~N}\right]$-pyrimidine was treated with sodium methoxide in methanol for 48 h at room temperature to yield $\mathbf{1}$ in $83 \%$ yield. Compound 2 was iodinated under standard conditions with $N$-iodosuccinimide in TFA/TFAA in $92 \%$ yield. ${ }^{3} \quad$ 5-O-tert-butyldiphenylsilyl-2,3-O-isopropylidene-D-ribono-1,4-lactone $\mathbf{3}$ was generated in two steps by reacting commercially available D-ribono-1,4-lactone with acetone in $\mathrm{H}_{2} \mathrm{SO}_{4}$ to generate 2,3-O-isopropylidene-D-ribono-1,4-lactone. This product was sufficiently pure without further purification for $5-O$ protection using tertbutyldiphenylsiloxylchloride with imidazole to yield compound $\mathbf{3}$ in $72 \%$ yield from 2.

Reagents and Conditions: (i) a) $\mathrm{POCl}_{3}, N, N$-dimethylaniline, $100^{\circ} \mathrm{C}, 3 \mathrm{~h}$; b) $\mathrm{NaOCH}_{3}, \mathrm{CH}_{3} \mathrm{OH}, 2$ days, $83 \%$. (ii) $N$-iodosuccinimide, TFA/TFAA, $5 \mathrm{~h}, 92 \%$.

Lactone $\mathbf{3}$ was added to a solution of $\mathbf{2}$ in THF after lithium-halogen exchange with tert-butyllithium to afford $\mathbf{4}$ in $77 \%$ yield. ${ }^{4}$ Stereoselective reduction of $\mathbf{4}$ using $\mathrm{ZnCl}_{2}$ and L-selectride gave diol 5 in $90 \%$ yield. Compound 5 was treated under Mitsunobu conditions with DIAD and triphenyl phosphine to afford 6 in $75 \%$ yield. ${ }^{1}$ Methyl groups on the pyrimidine ring were removed by refluxing with NaI and acetic acid for 35 min . Deprotection of the isopropylidene and tert-butyldiphenylsilyl groups under acidic conditions ( $9: 1 \mathrm{TFA}: \mathrm{H}_{2} \mathrm{O}$ ) gave [ $\left.1,3-{ }^{15} \mathrm{~N}\right]$-pseudouridine in $96 \%$ yield over two steps. ${ }^{5}$

5'-O-silyl-2'-O-orthoester phosphoramidite chemistry was employed for RNA synthesis. ${ }^{6,7}$ For this purpose, a $5^{\prime}-O-\mathrm{BzH}-2^{\prime}-O-\mathrm{ACE}-\left[1,3-{ }^{15} \mathrm{~N}\right]-$ pseudouridine phosphoramidite was synthesized. Compound $\mathbf{8}$ was treated with tris(2acetoxyethoxy)orthoformate in the presence of pyridinium $p$-toluenesulfonate and 4-(tert-butyldimethylsilyloxy)-3-penten-2-one (TBDMS-acac) for 2'-O-ACE protection. This reaction requires $55^{\circ} \mathrm{C}$ and increasing equivalents of TBDMS-acac and ACE for

[^0]successful product conversion. The $3^{\prime}, 55^{\prime}$-TIPDS group was deprotected using a combination of HF in TMEDA at $0^{\circ} \mathrm{C}$ to yield 9 in $65 \%$ yield. Compound 9 was reacted with BzHCl and diisopropylamine at $0{ }^{\circ} \mathrm{C}$ to afford $\mathbf{1 0}$ in $65 \%$ yield. Finally phosphoramidite synthesis was completed by the addition of methyl tetraisopropylphosphorodiamidite and 1 H -tetrazole to generate $5^{\prime}-\mathrm{O}-\mathrm{BzH}-2^{\prime}-\mathrm{O}-\mathrm{ACE}-[1,3-$ $\left.{ }^{15} \mathrm{~N}\right]$-pseudouridine phosphoramidite 11 in $52 \%$ yield.

Reagents and Conditions: (i) a) acetone, $\mathrm{H}_{2} \mathrm{SO}_{4}, 0^{\circ} \mathrm{C} \rightarrow \mathrm{rt}, 5 \mathrm{~h}$; b) TBDPSCl, imidazole, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 12 \mathrm{~h}$, $85 \%$ for two steps. (ii) THF, $-72{ }^{\circ} \mathrm{C}, 2.5 \mathrm{~h}, 76 \%$. (iii) a) $\mathrm{ZnCl}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-72{ }^{\circ} \mathrm{C}, 30 \mathrm{~min}$; b) L-selectride, -72 ${ }^{\circ} \mathrm{C} \rightarrow \mathrm{rt}, 16 \mathrm{~h}, 90 \%$. (iv) $\mathrm{PPh}_{3}$, DIAD, THF, $0{ }^{\circ} \mathrm{C} \rightarrow \mathrm{rt}, 24 \mathrm{~h}, 75 \%$. (v) a) $\mathrm{NaI}, \mathrm{CH}_{3} \mathrm{COOH}, 35 \mathrm{~min}$; b) TFA: $\mathrm{H}_{2} \mathrm{O}$ (9:1), $1 \mathrm{~h}, 96 \%$.

Reagents and Conditions: (i) $\mathrm{TIPDSCl}_{2}$, pyridine, $0{ }^{\circ} \mathrm{C} \rightarrow \mathrm{rt}, 12 \mathrm{~h}, 94 \%$. (ii) a) tris(2acetoxyethyl)orthoformate, pyridinium p-toluenesulfonate, 4-(tert-butyldimethylsilyloxy)-3-penten-2-one, dioxane, $55^{\circ} \mathrm{C}, 12 \mathrm{~h}$; b) TEMED-HF, $\mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \mathrm{C}, 3 \mathrm{~h}, 65 \%$. ## 2,4-Dimethoxy-[1,3- $\left.{ }^{15} \mathrm{~N}\right]$-pyrimidine (1)

$\left[1,3-{ }^{15} \mathrm{~N}\right]$-uracil ( $1.00 \mathrm{~g}, 8.77 \mathrm{mmol}, 1.0 \mathrm{eq}$ ) reacted with $5 \mathrm{~mL} \mathrm{POCl}_{3}$ and $3 \mathrm{~mL} \mathrm{~N}, \mathrm{~N}$ dimethylaniline under argon at $100{ }^{\circ} \mathrm{C}$ for 3 h . After TLC showed product conversion, the reaction was quenched with ice and extracted with ether. The organic layer was evaporated to yield a yellow solid. In a separate flask, $\mathrm{Na}(1.21 \mathrm{~g}, 52.63 \mathrm{mmol}, 6.00 \mathrm{eq})$ was added to 20 mL of dry methanol at $0{ }^{\circ} \mathrm{C}$. After $\mathrm{H}_{2}$ effervescence ceased, the yellow solid was added and allowed to stir at room temperature for 2 days. The reaction was quenched with $30 \% \mathrm{NaOH}$, extracted with ether and purified on silica gel using $33 \%$ ethyl acetate in hexanes to yield an organic liquid 1 in $83 \%$ yield ( 1.03 g ). ${ }^{1} \mathrm{H}$ NMR ( 500 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta(\mathrm{ppm}) 3.91(\mathrm{~s}, 3 \mathrm{H}), 3.94(\mathrm{~s}, 3 \mathrm{H}), 6.32(\mathrm{~d}, 1 \mathrm{H}, J=5.0 \mathrm{~Hz}), 8.13(\mathrm{dd}, 1 \mathrm{H}, J$ $=5.5,6.0 \mathrm{~Hz}$ ); ${ }^{13} \mathrm{C}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}) 53.62,53.65,101.99,158.19$, $165.38(\mathrm{dd}, 1 \mathrm{C}, J=9.3 \mathrm{~Hz}), 171.37\left(\mathrm{~d}, 1 \mathrm{C}, J=9.3 \mathrm{~Hz}\right.$ ), ESI-MS (ES $\left.{ }^{+}\right) m / z$ calcd for $\mathrm{C}_{6} \mathrm{H}_{8}{ }^{15} \mathrm{~N}_{2} \mathrm{O}_{2}$ 142.1, found $143.0\left(\mathrm{MH}^{+}\right)$.

To a solution of $6(0.35 \mathrm{~g}, 0.63 \mathrm{mmol}, 1.0 \mathrm{eq})$ in glacial acetic acid ( 15 mL ) was added sodium iodide ( $0.38 \mathrm{~g}, 2.53 \mathrm{mmol}, 4.0 \mathrm{eq}$ ) and heated to reflux for 35 min . The reaction mixture was poured onto ice and the resulting aqueous layer extracted with chloroform ( $3 \times 30 \mathrm{~mL}$ ). The combined organic extracts were washed with saturated solutions of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and $\mathrm{NaHCO}_{3}$ for several times and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was evaporated under reduced pressure to afford a light-yellow oil. A white solution was obtained after TFA/ $\mathrm{H}_{2} \mathrm{O}(9 / 1,10 \mathrm{~mL})$ added to this light-yellow oil. Stirring was continued for 1 h . TFA and water were evaporated under reduced pressure in hot water bath. ## Synthesis, Deprotection, and Purification of Modified RNA Oligonucleotides

RNAs were synthesized on $1.0 \mu \mathrm{~mol}$ scales using polystyrene supports as described previously. The sequences of the three RNAs are as follows, with the numbering based on the full-length E. coli 23S rRNA: 5'$\mathrm{G}_{1906} \mathrm{GCCG}^{15} \mathrm{~N} \Psi_{1911} \mathrm{AAC}_{1915} \mathrm{~A}_{1917} \mathrm{AACGGUC}_{1924}-3^{\prime}$ (referred to as ${ }^{15} \mathrm{~N} \Psi \Psi \Psi$; the names of the RNAs correspond to the nucleotides at positions 1911, 1915, and 1917, respectively), and $5^{\prime}-\mathrm{G}_{1906} \mathrm{GCCG} \Psi_{1911} \mathrm{AAC}^{15} \mathrm{~N}_{1915} \mathrm{~A}_{1917} \mathrm{AACGGUC}_{1924}-3^{\prime}\left(\Psi^{15} \mathrm{~N} \Psi \Psi\right)$, and $5^{\prime}-\mathrm{G}_{1906} \mathrm{GCCG} \Psi_{1911} \mathrm{AAC}^{15} \mathrm{~N} \Psi_{1915} \mathrm{~A} \Psi_{1917} \mathrm{AACGGUC}_{1924}-3^{\prime}\left(\Psi \Psi^{15} \mathrm{~N} \Psi\right)$, where ${ }^{15} \mathrm{~N} \Psi$ refers to the a $\left[1,3-{ }^{15} \mathrm{~N}\right]$ pseudouridine insertion site. The crude RNAs were deprotected using 100 mM NaOAc buffer ( pH 3.8 ) and heating the solution at $60^{\circ} \mathrm{C}$ for 30 min . The RNAs were purified on a Xterra MS C18 column ( $2.5 \mu \mathrm{~m}, 10 \times 50 \mathrm{~mm}$, Waters, MA) using HPLC. The eluent was 0.1 M TEAA buffer, pH 7.0 with a 7 to $11 \%$ linear gradient of acetonitrile over 17 minutes at a flow rate of $4.5 \mathrm{~mL} / \mathrm{min}$. Following HPLC purification, the RNAs were ethanol precipitated with NaOAc , and dialyzed for 3 days against RNase-free, double-deionized water.

RNA concentrations were calculated using Beer's law and single-stranded extinction coefficient ( $\Sigma$ ) was calculated to be $188,860 \mathrm{~cm}^{-1} \mathrm{M}^{-1}$ for each RNA. The extinction coefficient for uridine $\left(1.0 \times 10^{4} \mathrm{~cm}^{-1} \mathrm{M}^{-1} \text { at } \mathrm{pH} 7.0\right)^{8}$ was used for pseudouridine because the nearest-neighbor extinction coefficient is unknown.

For NMR sample preparation, the RNA was dissolved in $200 \mu \mathrm{~L} 90 \% \mathrm{H}_{2} \mathrm{O}$ and $10 \%$ $\mathrm{D}_{2} \mathrm{O}$ containing a buffer which contained NMR buffer ( $30 \mathrm{mM} \mathrm{NaCl}, 10 \mathrm{mM}$ sodium phosphate and 0.5 mM Na 2 EDTA, at pH 6.5 ). This solution was heated to $90^{\circ} \mathrm{C}$ for 2 minutes, and slowly cooled to room temperature for proper hairpin annealing. The solution was added to an NMR Shigemi tube, and residual RNA left in the centrifuge tube was washed with $80 \mu \mathrm{~L}$, and added to NMR Shigemi tube to yield a final volume of $280 \mu \mathrm{~L}$. The RNA concentrations for the RNAs were determined to be in the range from $0.5-1.0 \mathrm{mM}$.

## Temperature-dependent imino ${ }^{1} \mathrm{H}$ NMR spectra

${ }^{1} \mathrm{H}$ NMR spectra for $\Psi^{15} \mathrm{~N} \Psi \Psi, \Psi^{15} \mathrm{~N} \Psi \Psi$, and $\Psi \Psi{ }^{15} \mathrm{~N} \Psi$ were obtained on a Varian Unity 500 MHz spectrometer at $3,10,15,21$ and 37 . Table 1 illustrates the chemical shifts of the imino region $(9-15 \mathrm{ppm})$ at $3^{\circ} \mathrm{C}$.

Temperature-dependent spectra of ${ }^{15} \mathrm{~N} \Psi \Psi \Psi$ are shown below.

## 1D imino NOE difference spectroscopy of ${ }^{15} \mathrm{~N} \Psi \Psi \Psi$

1D imino NOE difference spectra of ${ }^{15} \mathrm{~N} \Psi \Psi \Psi$ were obtained at $3{ }^{\circ} \mathrm{C}$ on a Unity Varian 500 MHz spectrometer. Asterisks indicate irradiated protons and arrows show NOEs.

## 2D ${ }^{15}$ N HMQC of $\Psi^{15} N \Psi \Psi$

A $2 \mathrm{D}{ }^{15} \mathrm{~N}$ HMQC spectrum of $\Psi^{15} \mathrm{~N} \Psi \Psi$ was obtained at $3{ }^{\circ} \mathrm{C}$ on a Bruker 700 MHz spectrometer. $\Psi_{1915} \mathrm{~N} 1$ was assigned to 135 ppm , based on its correlation with the triplet at 10.7 ppm . The triplet at 10.7 was assigned to $\Psi_{1915} \mathrm{~N} 1 \mathrm{H}$ because of a strong NOE at $7.4 \mathrm{ppm}\left(\Psi_{1915} \mathrm{H} 6\right) . \Psi_{1915} \mathrm{~N} 3$ was assigned to 159 ppm , because it correlates to a broad proton peak at $10.4 \mathrm{ppm}\left(\Psi_{1915} \mathrm{~N} 3 \mathrm{H}\right)$.

Table S2：Key NOEs involving pseudouridines observed in $\Psi \Psi \Psi ~ H 69 ~ R N A ~(5 '-~$ GGCCGYAACЧA sodium phosphate， pH 7 buffer．The results are consistent with strong stacking of C1914 with $\Psi 1915$ and tri－nucleotide stacking of A1916，$\Psi 1917$ ，and A1918．
