### $\alpha_2^H$ values for radical 1 from $K_{HB}$ measured in benzene.

Hunter and co-workers have recently proposed two “universal” donor and acceptor scales referred to H-bond formation in a ideally apolar solvent. Binding free energies in real solvents between a donor ( $\alpha$ ) and an acceptor ( $\beta$ ) can be calculated within reasonable accuracy by using equation 1, if  $\alpha_s$  and  $\beta_s$  values of the employed solvent (or solvent mixtures) are known. Hunter’s  $\alpha$  and  $\beta$  parameters can be derived from the widely known Abraham  $\alpha_2^H$  and  $\beta_2^H$  values, which refer to  $CCl_4$ , by using equations 2 and 3.<sup>1</sup>

$$\Delta G^\circ (\text{kJ mol}^{-1}) = -(\alpha - \alpha_s)(\beta - \beta_s) + 6 \quad (1)$$

$$\alpha = 4.1(\alpha_2^H + 0.33) \quad (2)$$

$$\beta = 10.3(\beta_2^H + 0.06) \quad (3)$$

In the present work, the  $\alpha$  value of **1** was obtained by equation 1, from the  $\alpha_s$  and  $\beta_s$  of benzene (1.0 and 2.2, respectively), the  $\Delta G^\circ$  measured by EPR in benzene, and the  $\beta$  of the co-solvents used for the experiment.

For instance, in the case of DMSO,  $K_{HB}$  was  $810 \pm 50 \text{ M}^{-1}$ , so  $\Delta G^\circ = -16.6 \text{ kJ/mol}$ . Equation 1 can be therefore re-written as equations 4, from which  $\alpha = 4.5$ .

$$-16.6 = -(\alpha - 1.0)(8.7 - 2.2) + 6 \quad (4)$$

- 1) Hunter, C. A. *Angew. Chem., Int. Ed.* 2004, **43**, 5310–5324. Cook, J. L.; Hunter, C. A.; Low, C. M. R.; Perez-Velasco, A.; Vinter J. G. *Angew. Chem. Int. Ed.* 2008, **47**, 1-4.

### Estimation of solvent effects not related to H-bonds formation

The dielectric effects of some solvents employed in the present work were estimated by studying the EPR spectrum of a radical in which the para OH group of **1** is replaced by a methoxyl group, that is, the 2,6-di-tert-butyl-4-methoxyphenoxy radical (**7**). It is expected that the variations of the **7** spectrum in different solvent mixtures should reflect only dielectric effects. The hyperfine splitting constants for **7** measured in different solvents mixtures are reported in Table S1, where it can be evidenced that the HBA solvents possess dielectric effects only at large concentrations. Thus, corrections to keep into account dielectric effects were performed only in the cases of EtCN and EtOAc at concentrations larger than 1 M.

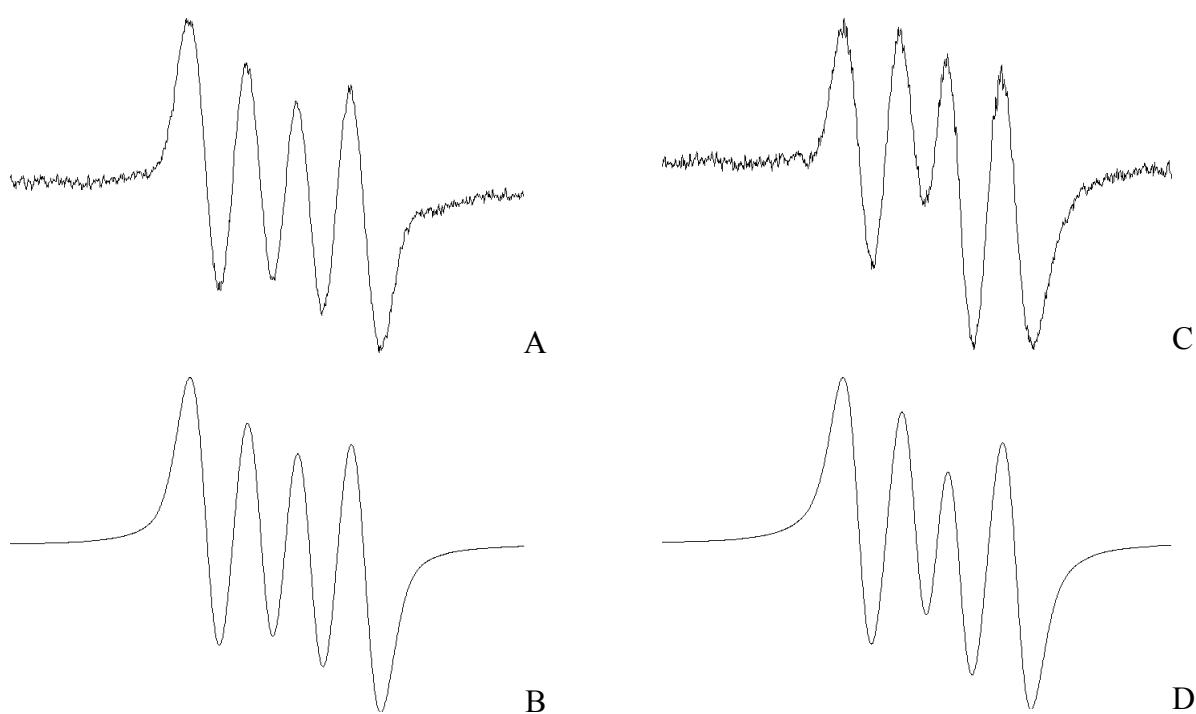

**Table S1.** Solvent effect on EPR spectrum of **7**.

solvent <sup>a</sup>	$a(2\text{H}_{\text{meta}}) / \text{G}$	$a(3\text{H}_{\text{para}}) / \text{G}$
benzene	0.94	1.56
DMSO 0.34 M	0.92	1.57
DMSO 0.67 M	0.92	1.59
DMSO 1.74 M	0.90	1.59
EtOAc 2.6 M	0.92	1.57
EtCN 0.7 M	0.92	1.57
EtCN 1.4 M	0.90	1.59

a) main solvent is benzene.

## Experiments with 4,6-di-tert-butyl-3-hydroxyphenoxy radical

The 4,6-di-tert-butyl-3-hydroxyphenoxy radical was generated by photolysis of a oxygen-free 0.015 M solution of the parent phenol in benzene, containing 10% v/v of tert-butylperoxide as radical initiator (see Figure S1). In the absence of the initiator, no spectrum was visible. The coupling constants were measured as 4.04 G ( $^1\text{H}_{\text{ortho}}$ ) and 2.13 G ( $^1\text{H}_{\text{meta}}$ ), typical of neutral phenoxy radicals. The coupling with the  $\text{H}_{\text{OH}}$  was too small to be detected. Even after the addition of relatively large amounts of HBA solvents, the spectrum did not change significantly (see Figure S1).

**Figure S1.** Spectrum obtained by irradiating 4,6-di-tert-butyl-3-hydroxyphenol in benzene with 10% of  $^t\text{BuOO}^t\text{Bu}$  (A) or with HMPA 0.14 M.

In the following section, the detailed results of EPR experiments are reported. In the first table, the experimental hyperfine splitting constants for **1** measured at each co-solvent concentration are shown. The concentrations of the co-solvents are corrected keeping into account that the parent phenol of **1** also act as H-bond donor by the two OH groups. These concentrations were calculated using the chemical kinetic and equilibrium simulator Gepasi<sup>2</sup> (version 3.30, <http://www.gepasi.org>) and the equilibrium constants were estimated by using the  $\alpha_2^H$  values of 4-OMe-phenol (0.57)<sup>3</sup> and of 2,6-di-tert-butyl-4-methylphenol (0.17).<sup>4</sup>

### Treatment of solvent effects by PCM method

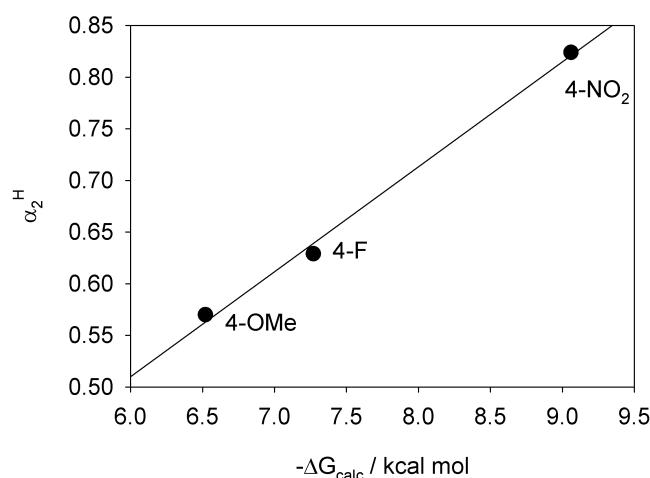

The energies of the interaction with DMSO for some reference phenols and for **4** were calculated using the PCM method and choosing benzene as solvent. The geometries were calculated in the gas phase. The H-bond strength has been calculated from the total free energies in solution.

**Table S3.** H-bond strength calculated at the B3LYP/6-31+g(d,p), solvent benzene.

	$-\Delta G_{\text{calc}} \text{ (PCM)} / \text{kcal mol}^{-1}$
4-OMe PhOH	6.52
4-F PhOH	7.27
4-NO <sub>2</sub> PhOH	9.06
4-OH PhO•	9.39

$$\alpha_2^{\text{H}} = -0.1016 \Delta G_{\text{calc}} \text{ (PCM)} - 0.0997$$

$$\alpha_2^{\text{H}} \text{ (4-OH PhO•)} = 0.85$$

**Figure S2.** Relation between literature  $\alpha_2^{\text{H}}$  and  $\Delta G_{\text{calc}}$ .
