## General

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded with a JEOL AL-400 spectrometer at 400 MHz and 100 MHz respectively using $\mathrm{CDCl}_{3}$ as a solvent. Chemical shift values for protons and carbons are reported in parts per million (ppm, $\delta$ scale) downfield from tetramethylsilane and are referenced to residual proton and carbon resources of $\mathrm{CDCl}_{3}$ respectively ( $\delta 7.26$ and 77.0 ). ESI-MS spectra were measured with Accu TOF. High-resolution mass spectra (HRMS) were measured on a JEOL JMS-GCMateII with FAB (Fast Atomic Bombardment) method. IR spectra were recorded by a IR Horiba FT730 spectrometer. Preparative thin-layer chromatography (PTLC) was performed with silica gel-precoated glass plates (Merck 60 GF254) prepared in our laboratory. All reactions were carried out under an atmosphere of argon in oven-dried glassware with a magnetic stirring bar. All reagents were purchased from Wako, Kanto, Aldrich and TCI and used without further purification.

## Experimental procedure

## General procedure for the nucleophilic addition of piperidine to styrene (Table 1, entry 6).

The mixture of $\left[\mathrm{Ru}(\text { benzene }) \mathrm{Cl}_{2}\right]_{2}(5.0 \mathrm{mg}, 0.010 \mathrm{mmol})$ and AgOTf ( $10.8 \mathrm{mg}, 0.042 \mathrm{mmol}$ ) in acetone was transferred to a Schlenk tube by a syringe filter under an atmosphere of argon. After acetone was excluded in vacuo and the container was backfilled with argon, a 1,4-dioxane solution $(0.12 \mathrm{~mL})$ of DPPPent ( $12.3 \mathrm{mg}, 0.028 \mathrm{mmol}$ ), styrene ( $91.5 \mu \mathrm{~L}, 0.80 \mathrm{mmol}$ ) and piperidine ( $40 \mu \mathrm{~L}$, 0.40 mmol ) was added. The reaction mixture was stirred at $100{ }^{\circ} \mathrm{C}$ for 72 h . Then, the solvent was removed in vacuo. The crude products were purified by thin-layer chromatography (hexane/AcOEt $=$ $1 / 1$ ) to give analytically pure $\mathbf{1}(78 \%)$.

## General procedure for enantioselective nucleophilic addition of piperidine to $\alpha$-methylstyrene

 (Table 3, entry 6).The mixture of $\left[\mathrm{Ru}(\text { benzene }) \mathrm{Cl}_{2}\right]_{2}(5.0 \mathrm{mg}, 0.010 \mathrm{mmol})$ and $\mathrm{AgOTf}(10.8 \mathrm{mg}, 0.042 \mathrm{mmol})$ in acetone was transferred to a Schlenk tube by a syringe filter under an atmosphere of argon. After acetone was excluded in vacuo and the container was backfilled with argon, a 1,4-dioxane solution $(0.12 \mathrm{~mL})$ of ( $S$ )-xylyl-BINAP ( $20.6 \mathrm{mg}, 0.028 \mathrm{mmol}$ ), $\alpha$-methylstyrene ( $78.2 \mu \mathrm{~L}, 0.60 \mathrm{mmol}$ ) and piperidine ( $40 \mu \mathrm{~L}, 0.40 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at $100^{\circ} \mathrm{C}$ for 72 h . Then, the solvent was removed in vacuo. The crude products were purified by thin-layer chromatography (hexane/ $\mathrm{AcOEt}=1 / 1$ ) to give analytically pure $4(52 \%, 76 \%$ ee).
