1. General Methods.

All starting materials were of the highest commercially available grade and used without further purification. Reactions were monitored by thin layer chromatography using silica gel HSGF254 plates. Flash chromatography (FC) was performed using silica gel HG/T2354-92. ^1H and ^{13}C NMR (300 and 75 MHz, respectively) spectra were recorded in CDCl_3 . ^1H NMR chemical shifts are reported in ppm (δ) relative to tetramethylsilane (TMS) with the solvent resonance employed as the internal standard (CDCl_3 , δ 7.26 ppm). Data are reported as follows: chemical shift, multiplicity (s = singlet, brs = broad singlet, d = doublet, t = triplet, q = quartet, m = multiplet), coupling constants (Hz) and integration. ^{13}C NMR chemical shifts are reported in ppm from tetramethylsilane (TMS) with the solvent resonance as the internal standard (CDCl_3 , δ 77.0 ppm). ESI HRMS spectra were recorded on BioTOF Q. HPLC analysis was performed on Waters-Breeze (2487 Dual λ Absorbance Detector and 1525 Binary HPLC Pump). Chiraldak AD and OJ columns were purchased from Daicel Chemical Industries (Hong Kong, China). Chiraldak OD column (Sino-chiral® OD) was purchased from Funsea Technology Inc. (Beijing, China). Optical rotations were measured on a Perkin-Elmer 341 Polarimeter at $\lambda = 589$ nm (c g/100 mL). All enantiomeric ratios have been controlled by coinjections of the pure sample with the racemic substrates.

3. General procedure for the preparation of N-(1,2-diphenylethylidene)-4-methoxyanilines **2a-2s**

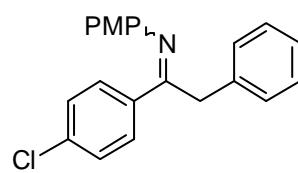

1,2-diarylethanones **8a-8s** were prepared according to the literature procedure.⁴ N-(1,2-diphenylethylidene)-4-methoxyanilines **2a-2s** were synthesized from **8a-8s** according to literature methods.⁵

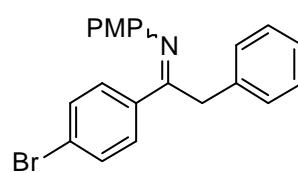

4-Methoxyaniline (27 mmol) and Et₃N (27 mmol) were dissolved in CH₂Cl₂ (60 mL) in the atmosphere of N₂. The mixture was cooled by an ice-salt bath. A solution of TiCl₄ (1.0 mL, 9 mmol) was introduced via syringe to the rapidly stirred mixture. After stirring for 30 min, the ice bath was removed, and stirring continued until the mixture reached room-temperature. Then 1,2-diarylethaneone (9 mmol) in CH₂Cl₂ (30 mL) was added via syringe. The temperature of the solution was raised to 40 °C and stirring was continued for 5 h. The solvent was evaporated and the residue was subjected to chromatography and subsequent recrystallization to afford **2a-2s**.

4. General procedure for the catalytic asymmetric hydrosilylation of N-(1,2-diphenylethylidene)-methoxyanilines 2a-2s

A solution of trichlorosilane (41 μL , 0.4 mmol, 2.0 equiv.) in 120 μL of CH_2Cl_2 was added to a stirred solution of the corresponding N-(1,2-diarylethylidene)- methoxyaniline (0.2 mmol) and the catalyst (0.02 mmol) in CH_2Cl_2 (3 mL) at -10°C. The mixture was stirred at the same temperature until the reaction was completed. Then the reaction was quenched with a saturated aqueous solution of NaHCO_3 and extracted with EtOAc. The combined extracts was washed with brine and dried over anhydrous Na_2SO_4 and the solvents were evaporated. Purification by column chromatography (silica gel, Petroleum ether/Ethyl acetate = 20:1) afforded the pure product. The e.e. values were determined using established HPLC techniques with chiral stationary phases.

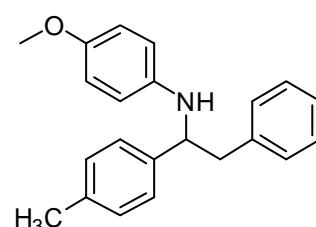

Racemates: All of the racemic products were prepared by using DMF (0.1equiv.) as a catalyst and trichlorosilane as hydrosilylation reagent and their chiral HPLC retention time data were compared just prior to authentic samples with enantiomeric excess.
